PERIODIC SAFETY FACTOR ASSESSMENT
391-3-4-.10(4) and 40 C.F.R. PART 257.73
PLANT HAMMOND ASH POND 2 (AP-2)
GEORGIA POWER COMPANY

The Federal CCR Rule, and, for Existing Surface Impoundments where applicable, the Georgia CCR Rule (391-3-4-.10) require the owner or operator of a CCR surface impoundment to conduct initial and periodic safety factor assessments. *See* 40 C.F.R. § 257.73(e); Ga. Comp. R. & Regs. r. 391.3-4-.10(4)(b)[1]. The owner or operator must conduct an assessment of the CCR unit and document that the minimum safety factors outlined in § 257.73(e)(1)(i) through (iv) for the critical embankment section are achieved. In addition, the Rules require a subsequent assessment be performed within 5 years of the previous assessment. *See* 40 C.F.R. § 257.73(f)(3); Ga. Comp. R. & Regs. r. 391.3-4-.10(4)(b) [1].

The CCR surface impoundment located at Georgia Power Company's Plant Hammond and referred to as the Plant Hammond Ash Pond 2 (AP-2) is on Plant Hammond property, in Coosa, Georgia, 1 mile west of the Rome, Georgia city limits in Floyd County. The CCR surface impoundment is formed by an engineered perimeter embankment. The critical section of this CCR unit was previously determined to be located on the northwest side of the perimeter embankment. Under current conditions, the northwest side of the perimeter embankment remains the critical section. The Notification of Intent to Initiate Closure was placed in the Operating Record on 8/31/2020 and closure has been designed to have no negative impacts on the stability of the perimeter embankment.

The analyses used to determine the minimum safety factor for the critical section resulted in the following minimum safety factors:

Loading Condition	Minimum Calculated Safety Factor	Minimum Required Safety Factor
Long-term Maximum Storage Pool (Static)	1.9	1.5
Maximum Surcharge Pool (Static)	1.9	1.4
Seismic	1.6	1.0

The embankment is constructed of sandy clays that are not susceptible to liquefaction. Therefore, a minimum liquefaction safety factor determination was not required.

[1] In a typographical error, 391.3-4.10(4)(b) references the "structural integrity criteria in 40 CFR 247.73," when the reference to such criteria should be 40 CFR 257.73.

This assessment is supported by appropriate engineering calculations which are attached.

I hereby certify that the safety factor assessment was conducted in accordance with 40 C.F.R. § 257.73 (e)(1).

Notes:

Purpose of Calculation

Ash Pond 2 was originally constructed in the late 1960s and a divider dike was installed in approximately 1998 to 2000. Currently, material stored in Ash Pond 2 is being excavated and transported to the Huffaker Road permitted solid waste disposal facility. The pond has been dewatered, and only receives rain that falls within its watershed. The stability of this structure was analyzed in 2016 for the CCR Rule. The purpose of this calculation is to update the stability analysis of the dike of Ash Pond 2.

Summary of Conclusions

The following table lists the factors of safety for various slope stability failure conditions. All conditions are steady state except where noted. Construction cases were not considered. The analyses indicate that in all cases the factor of safety is above the require minimum.

Load Conditions	Computed Factor of Safety	Required Minimum Factor of Safety
Long-term Maximum Storage (Static)	1.9	1.5
Maximum Surcharge Pool (Static)	1.9	1.4
Seismic	1.6	1.0

Methodology

The calculation was performed using the following methods and software:

- GeoStudio 2021 R2 version 11.1.1.22085 Copyright 1991-2021, GEO-SLOPE International, Ltd.
- Strata (Version 0.8.0),University of Texas, Austin
- Morgenstern-Price analytical method

Criteria and Assumptions

The slope stability models were run using the following assumptions and design criteria:

- Seismic site response was determined using a one-dimensional equivalent linear site response analysis. The analysis was performed using Strata and utilizing random vibration theory. The input motion consisted of the USGS published 2014 Uniform Hazard Response Spectrum (UHRS) for Site Class B/C at a 2% Probability of Exceedance in 50 years. The UHRS was converted to a Fourier Amplitude Spectrum, and propagated through a representative one-dimensional soil column using linear wave propagation with strain-dependent dynamic soil properties. The input soil properties and layer thickness were randomized based on defined statistical distributions to perform Monte Carlo simulations for 100 realizations, which were used to generate a median estimate of the surface ground motions.
- The median surface ground motions were then used to calculate a pseudostatic seismic coefficient for utilization in the stability analysis using the approach suggested by Bray and Tavasarou (2009). The procedure calculates the seismic coefficient for an allowable seismic displacement and a probability exceedance of the displacement. For

this analysis, an allowable displacement of 0.5 ft, and a probability of exceedance of 16% were conservatively selected, providing a seismic coefficient of 0.070g for use as a horizontal acceleration in the stability analysis.

- The current required minimum criteria (factors of safety) were taken from the Structural Integrity Criteria for existing CCR surface impoundment from 40 CFR 257.73, published April 17, 2015.
- The soil properties of unit weight, phi angle, and cohesion were obtained from triaxial shear testing performed on UD samples of the fill and foundation soils obtained during drilling in March 2010. The testing was performed according to ASTM D 4767.
- Properties for ash were based on laboratory testing performed on undisturbed and remolded samples of ash from various plants and on engineering judgment.
- In March 2010, piezometers were installed in the dike fill, the foundation soils and in the ash. These piezometers, in conjunction with survey data, were used to obtain current water elevations within the dike and the foundation soils.
- The COE EM 1110-2-1902, October 2003, allows the use of the phreatic surface established for the maximum storage condition (normal pool) in the analysis for the maximum surcharge loading condition. This is based on the short term duration of the surcharge loading relative to the permeability of the embankment and the foundation materials. This method is used in the analysis for the impoundments at this facility with surcharge loading.
- According to the NOAA website, the flood elevation for the Coosa River at Plant Hammond is elevation 570 feet. This elevation is well below the toe of all ash pond dikes. Therefore, flood cases were not evaluated.

<u>Ash Pond 2</u>

- The cross-section of Ash Pond 2 was obtained using the following sources:
  1) March 2010 survey for the top of the dike and downstream surface of the dike, the width of the ash “platform” on the upstream side of the dike, and the elevations of water within the pond and in the discharge canal at the toe of the pond.
  2) Original design Drawing No. H-401 for the upstream surface of the dike.
  3) Drawing No. E8544, Excavation Plan, for the elevation of the ash on the interior of the pond.
- Groundwater elevations through the dike were determined from piezometers installed in March 2010.

The following soil properties were used in the analyses. This data was obtained from laboratory triaxial testing performed in March 2010 by S&ME. The laboratory testing consisted of classification testing as well as consolidated-undrained triaxial tests with pore pressure measurements in order to provide both total and effective shear strength parameters of the embankment and foundation soils. Sample disturbance during the sampling effort as well as variations in the soil specimens (wide range of void ratios, initial saturation conditions, gravel content, and dry unit weights) resulted in inconsistencies in the test results. This prevented S&ME from reporting the total stresses for five of the tests and to suggest that these inconsistencies be considered when interpreting and applying the data. The laboratory data for the five tests were reviewed in order to estimate total stress parameters that would conservatively represent the soil types indicated by the classification tests. Failure criteria were established at lower strains occurring near the maximum pore pressures developed during the test procedures. These parameters have been added to the following table and are consistent with the remaining total stress parameters reported by S&ME. The effective stress interpretations provided by S&ME were used in the analyses.

Soil Description	Dry Unit Weight, pcf	Moist Unit Weight, pcf	Effective Stress Parameters		Total Stress Parameters	
			Cohesion, psf	Phi Angle, degrees	Cohesion, psf	Phi Angle, degrees
Sandy Clay Dike Fill	112.4	129	140	37.3	300	21
Sandy Clay Fdn Soil	98.8	124	280	29.9	850	18.9
Sluiced Ash		80	0	10	0	10

Hydrologic Considerations

Ash Pond 2 was used as a dewatering pond when the plant was producing ash. Under those conditions, the maximum surcharge condition was analyzed using a water elevation of 597.2 in the pond. As the amount and distribution of the remaining ash varies from day to day, we will continue to utilize that value for the maximum surcharge condition and with the ash layer equal to the crest of the dike elevation for the purposes of this calculation.

Load Conditions

The impoundment dike at Plant Hammond Ash Pond 1 was evaluated for load conditions consisting of long-term maximum storage, maximum surcharge pool, and seismic.

Soil Laboratory Analysis

April 21, 2010

Southern Company Services
241 Ralph McGill Boulevard
16th Floor, Bin 10185
Atlanta, Georgia 30308

Attention: Mr. Gary H. McWhorter

Subject: Plant Hammond Ash Pond Dikes
S&ME Job No. 28900

Gentlemen:

S&ME, Inc. has completed the laboratory testing on the soil samples sent by your office. The following tests were performed:

- Atterberg Limits
- Sieve Analysis
- Triaxial Shear

S&ME, Inc. performs soil tests in general accordance with the applicable American Society for Testing and Materials (ASTM) or AASHTO procedures. These procedures are generally recognized as the basis for uniformity and consistency of test results in the geotechnical engineering profession. All the work is supervised by a qualified engineer. Attached are test results for your review. While S&ME is not responsible for the use or interpretation of these data we note that the test results do not appear to be consistent with our expectations for materials with these unified soil classifications.

S&ME, Inc. appreciates the opportunity to provide these laboratory services. Please contact us if you have any questions concerning this report or if we may be of further service.

Respectfully submitted,

S&ME, Inc.

Ashok K. Mangla
Geotechnical Laboratory Manager

Richard Mockridge, P.E.

SOIL DESCRIPTION :	-						
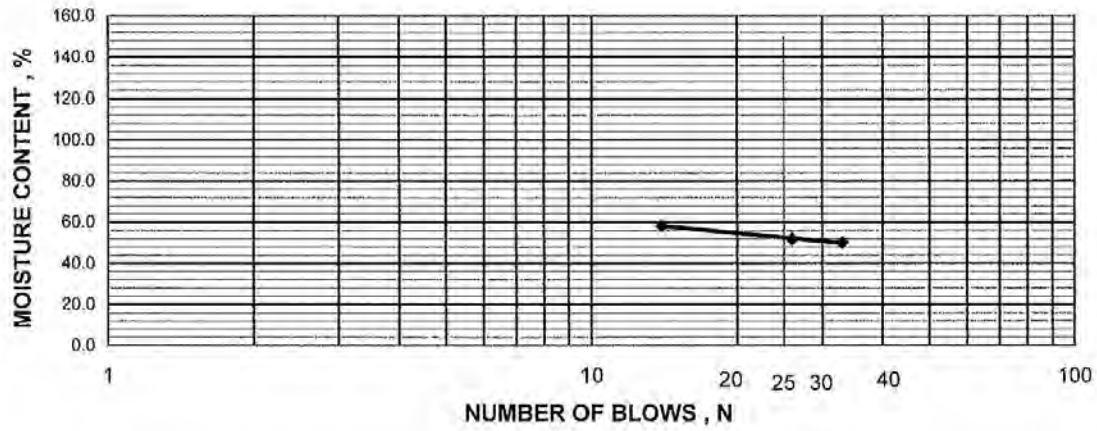
LIQUID LIMIT , % :	*53*	*PLASTIC LIMIT ,% :*	*22*	*PLASTICITY INDEX ,% :*	*31*	MOISTURE , % :	18
CLASSIFICATION :		UNIFIED :	CH	AASHTO :	-	FINES , % :	70

LIQUID LIMIT , % MOISTURE AT THE ARBITRARY DEFINED BOUNDARY BETWEEN LIQUID & PLASTIC STATES --

% MOISTURE AT WHICH SOIL FLOWS FOR A DISTANCE OF 13 MM (1/2 ") AT THE BASE OF GROOVE WHEN SUBJECTED TO 25 BLOWS

TEST NO. :	1		2		3		4		5
CONTAINER NO.	25		26		27	BRAND	MODEL	SERIAL	
NUMBER OF BLOWS	33		26		14	BALANCE	PRECISA	2200 C	
WT. WET SOIL + CAN (GRAMS)	28.47		29.15		29.20	LL MACHINE	HUMBOLT	1	
WT. DRY SOIL + CAN (GRAMS)	24.04		24.66		24.33	BALANCE	OHAUS-3100 G	ARC120	
WT. OF WATER (GRAMS)	4.43		4.49		4.87	OVEN	DESPATCH-3436	1650032533	
WT. OF CONTAINER (GRAMS)	15.20		16.00		15.96				
WT. OF DRY SOIL (GRAMS)	8.84		8.66		8.37				
WATER CONTENT, (%)	50.11		51.85		58.18				



PLASTIC LIMIT , % MOISTURE AT THE ARBITRARY DEFINED BOUNDARY BETWEEN PLASTIC & BRITTLE STATES --

% MOISTURE AT WHICH SOIL CAN NO LONGER BE DEFORMED BY ROLLING INTO 3.2 MM (1/8")IN DIAMETER THREADS WITHOUT CRUMBLING

TEST NO. :	1		2		3		4		5
CONTAINER NO.	18		19						
WT. WET SOIL + CAN (GRAMS)	22.72		23.04						
WT. DRY SOIL + CAN (GRAMS)	21.37		21.64						
WT. OF WATER (GRAMS)	1.35		1.40						
WT. OF CONTAINER (GRAMS)	15.24		15.06						
WT. OF DRY SOIL (GRAMS)	6.13		6.58						
WATER CONTENT, (%)	22.02		21.28						

PLASTICITY INDEX - THE RANGE OF % MOISTURE CONTENT OVER WHICH SOIL BEHAVES PLASTICALLY -

THE DIFFERENCE BETWEEN LIQUID LIMIT & PLASTIC LIMIT PI = LL - PL
