Exceeds Limit: GWC-14

Prediction Limit  
Interwell Non-parametric

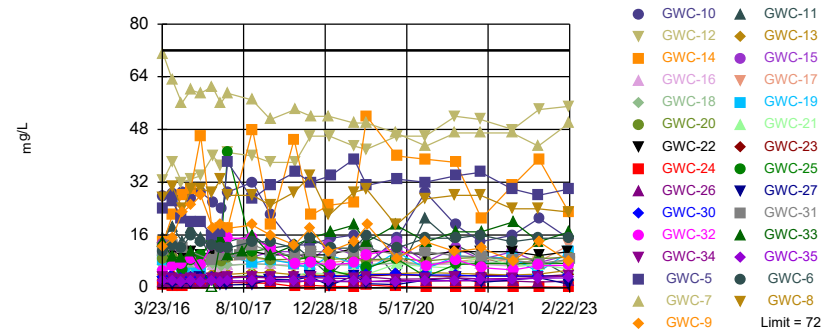

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 125 background values. 97.6% NDs. Annual per-constituent alpha = 0.00719. Individual comparison alpha = 0.0001244 (1 of 2). Comparing 29 points to limit.

Constituent: Boron Analysis Run 4/3/2023 9:19 AM View: PLs Interwell App III  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Within Limit

Prediction Limit  
Interwell Non-parametric

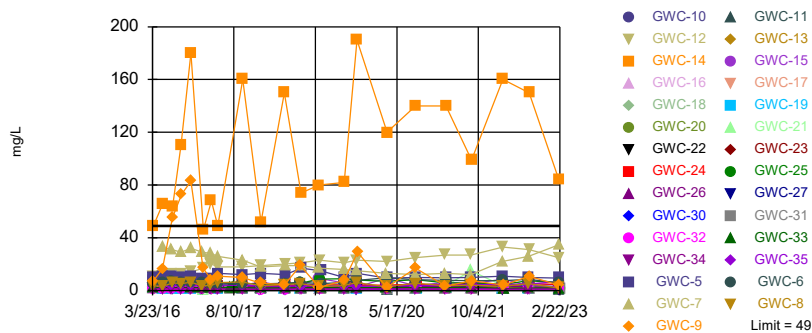

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 124 background values. 0.8065% NDs. Annual per-constituent alpha = 0.007289. Individual comparison alpha = 0.0001261 (1 of 2). Comparing 29 points to limit.

*Statistical Analysis Reports  
August 2023 Monitoring Event*

# GROUNDWATER STATS CONSULTING

January 31, 2024

Southern Company Services  
Attn: Ms. Kristen Jurinko  
241 Ralph McGill Blvd NE, Bin 10160  
Atlanta, Georgia 30308

Re: Plant Wansley Landfill – August 2023 Statistical Analysis

Dear Ms. Jurinko,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the August 2023 Semi-Annual Groundwater Monitoring Statistical summary of the analysis of groundwater data for Georgia Power Company's Plant Wansley Landfill. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the CCR program in 2016, and for the State program in 2011 in accordance with the Georgia EPD's Solid Waste Permit. At least 8 background samples have been collected at each of the groundwater monitoring wells. Semi-annual sampling is performed in accordance with the Georgia Department of Natural Resources, Environmental Protection Division groundwater monitoring regulations; and the August 2023 samples are evaluated in this report.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-1, GWA-2, GWA-3, GWA-4, GWA-28, and GWA-29
- **Downgradient wells:** GWC-5, GWC-6, GWC-7, GWC-8, GWC-9, GWC-10, GWC-11, GWC-12, GWC-13, GWC-14, GWC-15, GWC-16, GWC-17, GWC-18, GWC-19, GWC-20, GWC-21, GWC-22, GWC-23, GWC-24, GWC-25, GWC-26, GWC-27, GWC-30, GWC-31, GWC-32, GWC-33, GWC-34, and GWC-35

While upgradient well GWA-3 and downgradient well GWC-24 have had periods of being historically dry, these wells have been consistently sampled over the past few years. Additionally, sampling began at downgradient well GWC-10 in 2016 for both the CCR and State programs. These well/constituent pairs are discussed below.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Kristina Rayner, Senior Statistician and Founder for Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The following constituents were evaluated:

- **CCR Appendix III** - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I** - antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix I well/constituent pairs with 100% non-detects follows this letter.

Time series plots for Appendix I and III parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Due to varying detection limits in background data sets due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent

reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well and may result in slight changes in statistical limits between sample events. Substitution of the most recent reporting limit generally gives the most conservative limit in each case. However, in the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group.

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods were recommended. Power curves were provided previously, based on a 1-of-3 resample plan for Appendix I constituents and a 1-of-2 resample plan for Appendix III constituents, to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. During the background update in March 2022, sufficient samples were available for Appendix I constituents to provide sufficient power using a 1-of-2 resample plan. A power curve was provided with the report. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

#### **Georgia EPD Appendix I Constituents:**

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (all parameters)
- # Constituents: 16
- # Downgradient wells: 29

#### **CCR Appendix III Constituents:**

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (pH, sulfate, and TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, calcium, chloride, and fluoride)
- # Constituents: 7
- # Downgradient wells: 29

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

### Two-Step Statistical Analysis

Intrawell statistical methods, combined with 1-of-2 plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods

use background data for individual wells and may be overly sensitive to spatial variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of spatial variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of SSIs that result from spatial variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless all resamples also exceed the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial

variation rather than a result of impact to groundwater quality downgradient of the facility.

## **Background Screening Summary – Georgia EPD Appendix I – Conducted in August 2019**

### Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits.

Using the Tukey box plot method, several outliers were identified. When the most recent values were identified as outliers, values were not flagged in the database at this time (except in cases where they would cause background limits to be elevated) as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values were observed trace values (i.e., measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers. Due to changing reporting limits for many constituents, when the non-detects were replaced with the most recent reporting limit, previously flagged "J" values (or estimated values) required flagging as outliers because they were much higher than current reporting limits.

Of the outliers identified by Tukey's method, several values were flagged in the database, and the remaining values were similar to other measurements within a given well or neighboring wells or were reported non-detects. Several other values were flagged in addition to those identified by Tukey's because the values were higher than all remaining concentrations and would cause the statistical limits to be elevated. A summary of all flagged values is included in Figure C.

Additionally, when any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well.

## Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

## Trend Test Analysis

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits. The required adjustments to the background data are performed by truncating data at the beginning of the record and the truncated data may be seen in a lighter font on the prediction limit data pages.

The results of the trend analyses showed several statistically significant increasing and decreasing trends; however, the majority of these were relatively low in magnitude when compared to average concentrations; therefore, most records required no adjustments at that time.

Exceptions included cobalt and nickel in downgradient well GWC-14 for which current measurements were higher than those reported historically for this well as well as higher than those observed upgradient of the facility. Therefore, trend tests were recommended in lieu of prediction limits and data prior to August 2017 were truncated for cobalt and nickel. An alternate source demonstration was, reportedly, prepared for cobalt and nickel and demonstrated that the concentration levels of these constituents are not a result of practices of the facility. During the March 2022 background update, these records were updated to use current data for construction of prediction limits and are included in the analysis.

## Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified statistical differences among the means or medians of the upgradient well data for the following constituents: barium, beryllium, cadmium, cobalt, copper, nickel, silver, and zinc. No differences were noted for antimony, arsenic, chromium, mercury, selenium, thallium, and vanadium. The ANOVA could not test lead as the upgradient well data had no variation.

Because this is a lined landfill with pre-waste data that show metals were present in low level detections during the collection of background data, intrawell prediction limits were recommended as the most appropriate statistical analysis at this landfill. It was also noted that for some constituents the reported concentrations were higher in upgradient wells which would result in limits that would not readily detect subtle changes in concentrations in downgradient wells.

## **Background Update Summaries**

### **CCR Appendix III – Conducted in March 2020**

#### Outlier Analysis

Prior to updating background data for Appendix III constituents, Tukey's outlier test and visual screening were used to evaluate data through September 2019. Tukey's test was used on all wells for constituents evaluated using intrawell methods and for only upgradient wells for constituents evaluated using interwell methods. While Tukey's test identified several outliers, only the most extreme values were flagged as such in the database because a number of the values appeared to be representative of spatial variation in both upgradient and downgradient wells. Other values, not identified by

Tukey's test, were identified visually and flagged as outliers in order to obtain statistical limits that are conservative (lower) from a regulatory perspective.

As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. An updated summary of flagged outliers follows this letter.

### Mann-Whitney Evaluation

For constituents requiring intrawell prediction limits (pH, sulfate, and TDS), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through August 2017 to the new compliance samples at each well through September 2019. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. The results of the Mann-Whitney test and discussion regarding updating background records were included with the background update report. Note that the record for sulfate at GWC-5 was adjusted to use the most recent 8 samples through September 2019 to construct the intrawell prediction limit at this well. All records for constituents using intrawell methods will be re-evaluated during the next background update as discussed earlier. The results and a summary of the background update were submitted with the report.

### **Wells GWA-3, GWC-10, and GWC-24 – August 2021**

#### Outlier Analysis

During the August 2021 analysis, the records for copper, nickel, silver, vanadium, and zinc in downgradient wells GWC-10 and GWC-24 and upgradient well GWA-3 were re-evaluated for outliers and trends through December 2020 in order to construct statistical limits with at least 8 values in background.

Tukey's outlier test and visual screening were used to evaluate data at these wells through December 2020. Note that for some well/constituent pairs, Tukey's test results were invalidated because the upper and lower quartiles were equal. While Tukey's test did not identify any outliers, the highest values for copper, silver, and zinc in well GWC-10 were identified visually through time series graphs and flagged as outliers since they did not appear to represent the population for these constituents at this well. This step reduces variation and results in statistical limits that are conservative (i.e., lower) from a regulatory perspective.

As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. A summary of all flagged outliers follows this letter.

### Trend Test Evaluation

As mentioned above, while trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at wells GWA-3, GWC-10, and GWC-24 for copper, nickel, silver, vanadium, and zinc. No significant trends were identified among data through December 2020 for any of the aforementioned well/constituent pairs; therefore, no adjustments were required. The trend test results were included with the August 2021 report.

## **Georgia EPD Appendix I and CCR Appendix III Constituents – March 2022**

### Outlier Analysis

Prior to updating background data, Tukey's outlier test and visual screening were used to evaluate data through August 2021. Tukey's test was used on all wells for Appendix I and III constituents evaluated using intrawell methods and for upgradient wells (pooled data) for Appendix III constituents evaluated using interwell methods. While Tukey's test identified several outliers, only the most extreme values were flagged as such in the database because a number of the values appeared to be representative of spatial variation in both upgradient and downgradient wells or resulted from reported trace values compared to non-detect measurements within a record. Other values, not identified by Tukey's test, were identified visually and flagged as outliers in order to obtain statistical limits that are conservative (lower) from a regulatory perspective.

As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. An updated summary of flagged outliers follows this letter.

### Mann-Whitney Evaluation

For constituents requiring intrawell prediction limits (all Appendix I constituents and pH, sulfate and TDS for the Appendix III constituents), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through June 2018 and September 2019, respectively, to new compliance samples at each well through August 2021. Background data sets for upgradient well GWA-3 and downgradient wells GWC-10

and GWC-24 for copper, nickel, silver, vanadium, and zinc were last updated during August 2021. The Mann-Whitney test requires a minimum of four compliance measurements. Therefore, these records currently had insufficient samples to test for updating and will be evaluated during the 2024 background update along with all other records.

If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. The Mann-Whitney test identified several statistically significant results. However, many of the differences resulted from reported trace values compared to non-detect results within a given record. In some cases, while the median of the compliance data was identified as significantly different from the historical median, the reported concentrations in more recent data were similar to those reported historically. In other cases, such as barium in wells GWC-12, GWC-16, GWC-18, GWC-21, GWC-26, and GWC-34 and zinc in well GWC-14, which had statistically significant increasing medians, the reported measurements at these wells are significantly lower than those reported in one or more upgradient wells indicating variation in groundwater quality unrelated to practices at the facility.

Therefore, all records were updated through August 2021 except for barium in well GWC-14 where compliance concentrations were higher than historical concentrations within this well, and higher than concentrations reported in upgradient wells. A trend test was recommended at that time in lieu of an intrawell prediction limit for this well/constituent pair. Further research which included an Alternate Source Demonstration (ASD), reportedly, demonstrated the measurements were a result of spatial variation rather than a result of practices at the facility and prediction limits resumed during the February 2023 analysis using a truncated portion of the more recent data for construction of the limit.

Additionally, the records for cobalt in wells GWC-5 and GWC-7 were truncated to use the more recent portion of the records with lower reported concentrations than those reported historically within each record. This step serves to provide prediction limits that are conservative (i.e., lower) from a regulatory perspective.

A summary of background date ranges for these well/constituent pairs, along with other well/constituent pairs with truncated records, follows this letter. All records for constituents using intrawell methods will be re-evaluated during the next background update as discussed earlier.

## Upgradient Well Trend Tests – Interwell Testing

The Sen's Slope/Mann Kendall trend test was used to evaluate data at upgradient wells for each of the Appendix III constituents requiring interwell prediction limits (boron, calcium, chloride, and fluoride) to identify statistically significant increasing or decreasing trends in background. The results of the trend analyses showed no statistically significant increasing or decreasing trends except for a statistically significantly decreasing trend in upgradient well GWA-29 for fluoride. Reported measurements in this well were similar to those in neighboring upgradient wells. Therefore, no adjustments were required.

## **Statistical Analysis of Georgia EPD Appendix I Constituents – August 2023**

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to spatial variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of spatial variation rather than impacts of the landfill.

## Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through August 2021, except for the cases mentioned above, for each well with detections (Figure D). No statistical analyses were required for well/constituent pairs with 100% non-detects. The August 2023 compliance data are compared to the intrawell background limits.

For some well/constituent pairs containing <15% non-detects, such as nickel at downgradient well GWC-35 and zinc at upgradient well GWA-28, parametric prediction limits slightly changed compared to those established during the background update. An update was made to the Sanitas™ statistical software in October 2022 that determines the

percentage of non-detects within a given background record rather than all records evaluated for a given constituent. Simple substitution of 1/2 the reporting limit is applied when the percentage of non-detects is <15% in accordance with the USEPA EPA Unified Guidance (2009). No significant changes resulted from this implementation.

As discussed earlier, trend tests were previously used in lieu of prediction limits for barium at downgradient well GWC-14 due to more recent reported higher measurements. However, an ASD was prepared that, reportedly, demonstrated more recent observations were due to variation of groundwater quality rather than a result of practices at the facility. Therefore, a truncated portion of the more recent data was used to construct an intrawell prediction limit and was used to evaluate barium at this well.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of an additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary of the Georgia EPD prediction limits follows this report. Exceedances were noted for the following well/constituent pairs:

- Barium: GWA-3 (upgradient), GWC-18, and GWC-35
- Nickel: GWC-9
- Zinc: GWC-9

### Two-Step Approach

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data to evaluate the initial intrawell prediction limit exceedances for the downgradient well/constituent pairs mentioned above (Figure E). The following exceedance was noted:

- Nickel: GWC-9

### Trend Test Analysis – Appendix I Constituents

Data from downgradient well/constituent pairs for Appendix I constituents found to exceed their respective prediction limit are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure F). Upgradient wells are included in the trend analyses for all

parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of variability in groundwater unrelated to practices at the site. A summary of the trend test results follows this letter and the following statistically significant trends were identified:

Increasing:

- Barium: GWA-4 (upgradient), GWC-18, and GWC-35
- Zinc: GWA-28 (upgradient)

Decreasing:

- Nickel: GWA-1, GWA-2, GWA-4, and GWC-29 (all upgradient)

### **Statistical Analysis of CCR Appendix III Parameters – August 2023**

As mentioned above, intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to determine whether apparent exceedances are present.

#### Intrawell Prediction Limits

For sulfate, pH, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through August 2021, except for the case of sulfate in well GWC-5 which uses historical data from 5/1/2017 through 8/19/2021 (Figure G). The August 2023 samples were compared to established statistical limits. No exceedances were noted for any of these well/constituent pairs.

#### Two-Step Approach

Following the two-step analysis procedure as mentioned above, interwell prediction limits would be constructed using pooled upgradient well data to evaluate any initial intrawell prediction limit exceedances. However, since no apparent exceedances were identified, no further action was necessary.

#### Interwell Prediction Limits

For boron, calcium, chloride, and fluoride which are evaluated using all historical upgradient well data through August 2023 to construct interwell prediction limits

combined with a 1-of-2 resample plan (Figure H). The following statistically significant increases were identified:

- Boron: GWC-9 and GWC-14

#### Trend Test Analysis – Appendix III Constituents

Data from downgradient well/constituent pairs for Appendix III constituents found to exceed their respective prediction limit are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure I). As mentioned above, upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of variability in groundwater unrelated to practices at the site. A summary of the trend test results follows this letter and no significant trends were identified for Appendix III parameters.

### **Resample Report – September 2023**

#### Appendix III Constituents

A resample was collected in September 2023 at downgradient well GWC-9 for the interwell exceedance identified for boron. An interwell prediction limit, combined with a 1-of-2 resample plan, was constructed for boron using all available upgradient well data through August 2023 to evaluate the resample (Figure J). An interwell prediction limit exceedance was noted.

### **Summary**

Based on the results of the August 2023 observations for Appendix I and III constituents and the September 2023 resample being compared to prediction limits, the following downgradient prediction limit exceedances were identified:

#### Appendix I

- Nickel: GWC-9

#### Appendix III

- Boron: GWC-9 and GWC-14

The Sen's Slope/Mann-Kendall trend test was used to identify statistically significant trends for any Appendix I and Appendix III well/constituent pairs initially found to exceed their respective prediction limit. The following statistically significant trends were identified:

Increasing:

- Barium: GWA-4 (upgradient), GWC-18, and GWC-35
- Zinc: GWA-28 (upgradient)

Decreasing:

- Nickel: GWA-1, GWA-2, GWA-4, and GWC-29 (all upgradient)

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Wansley Landfill. If you have any questions or comments, please feel free to contact us.

### Box & Whiskers Plot

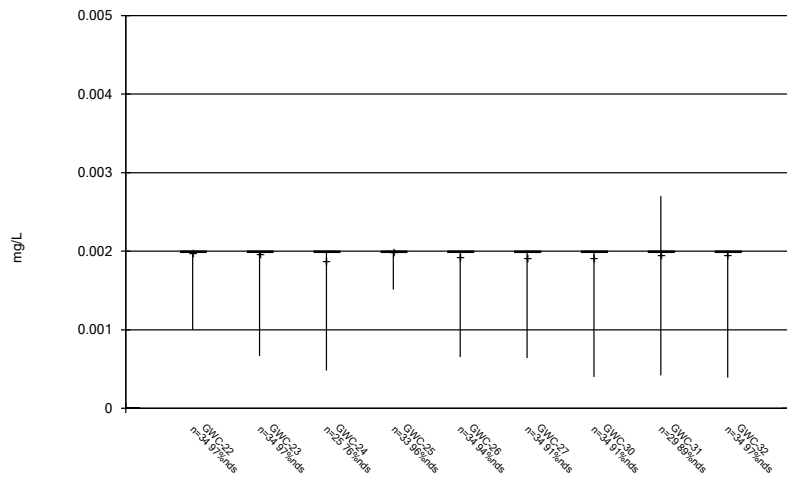

Constituent: Antimony Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

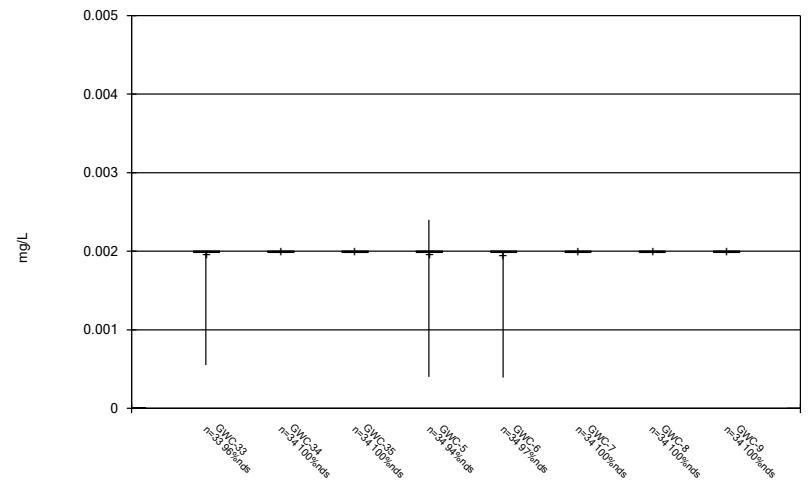

Constituent: Antimony Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

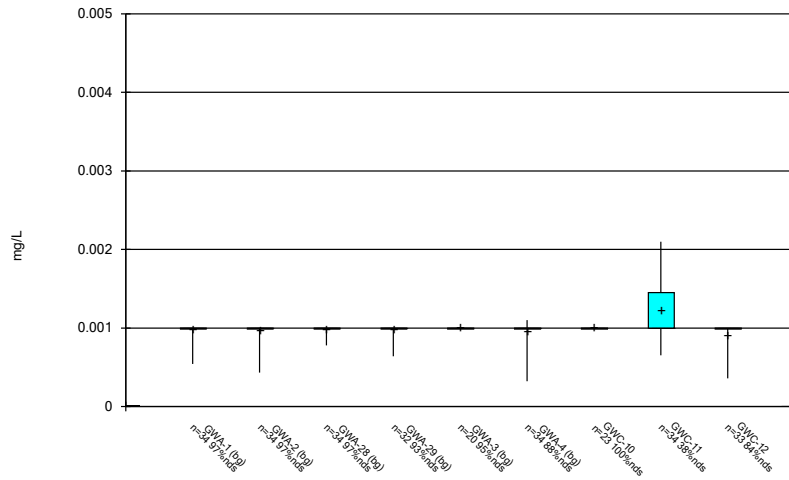

Constituent: Antimony Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

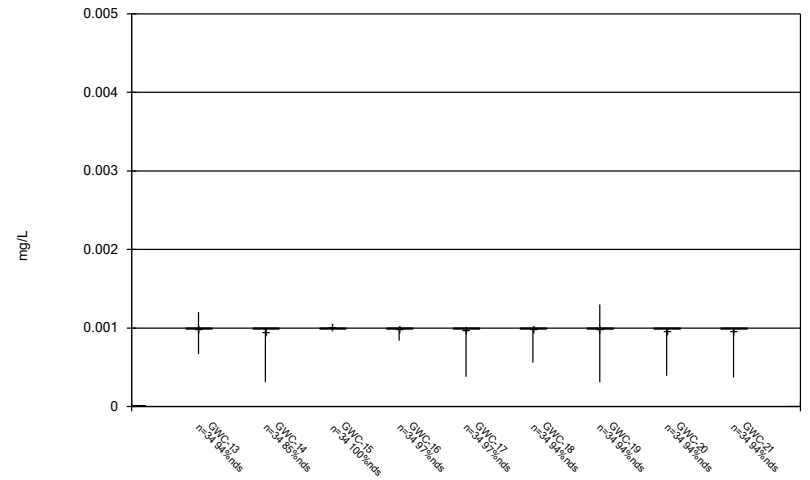

Constituent: Antimony Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

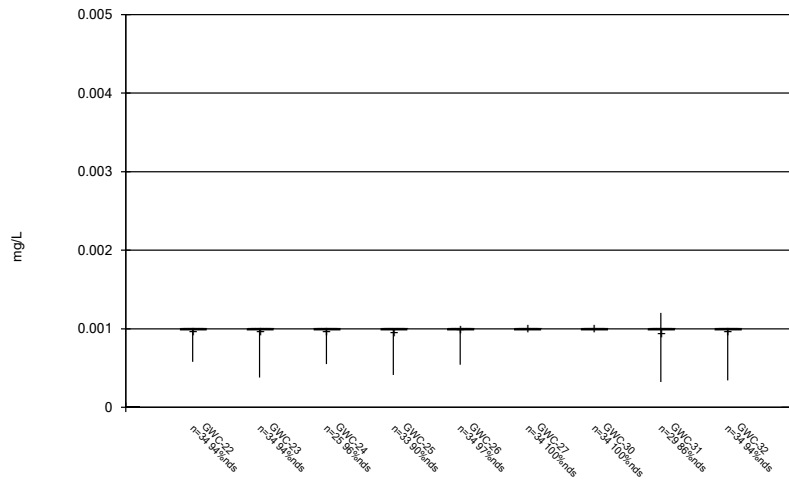

Constituent: Arsenic Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

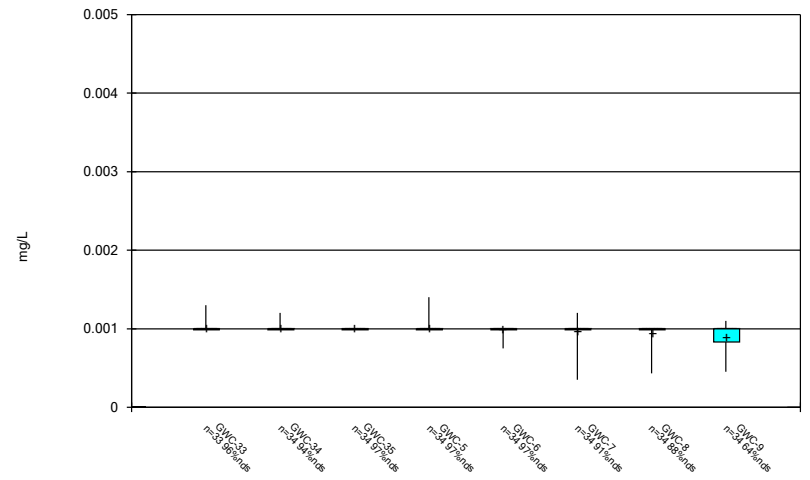

Constituent: Arsenic Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

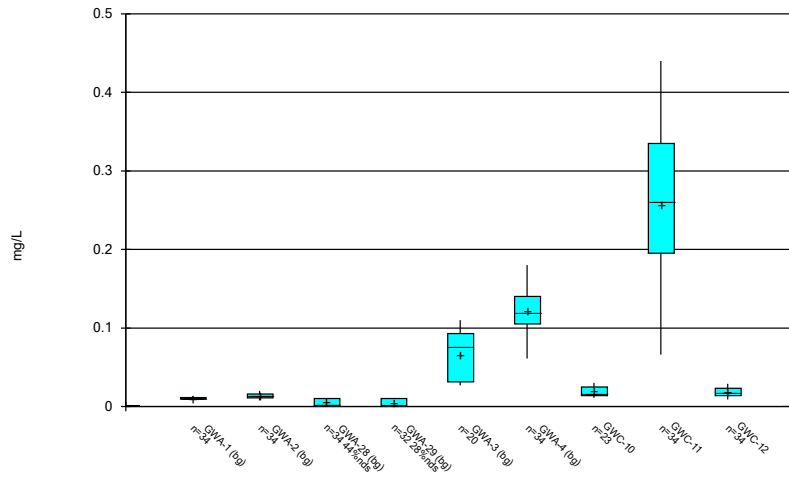

Constituent: Arsenic Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

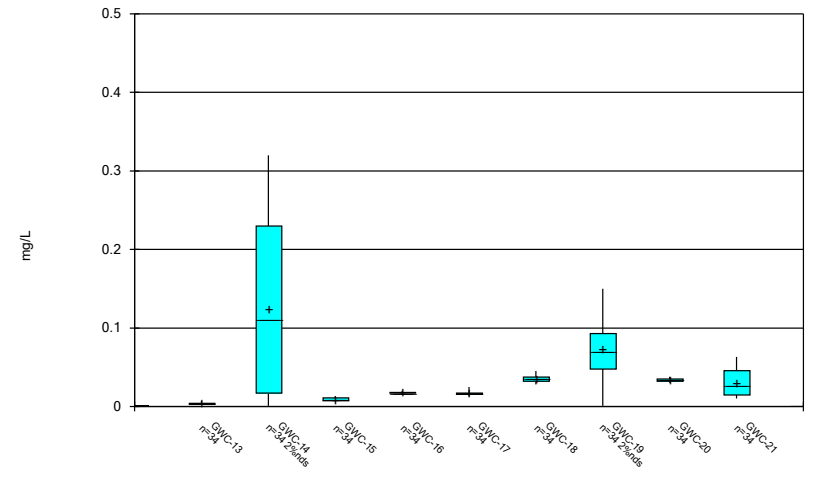

Constituent: Arsenic Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

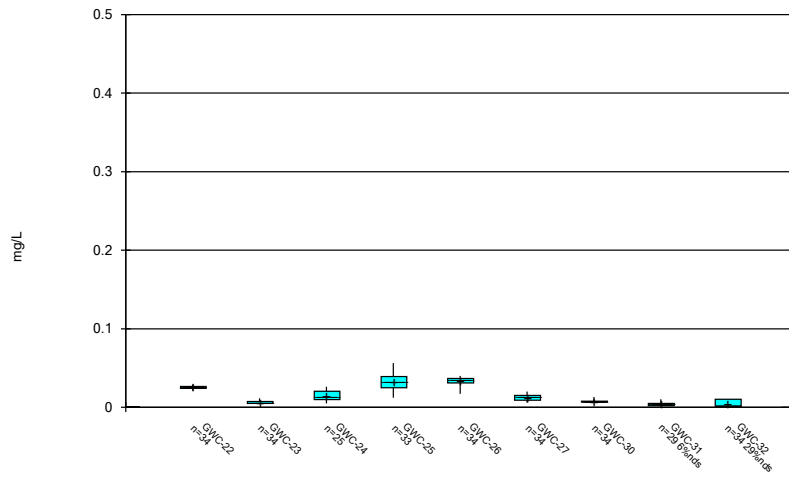

Constituent: Barium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

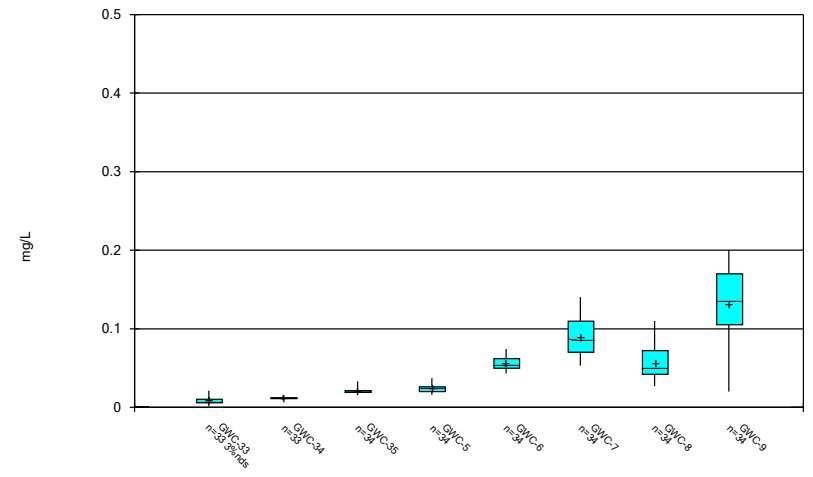

Constituent: Barium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

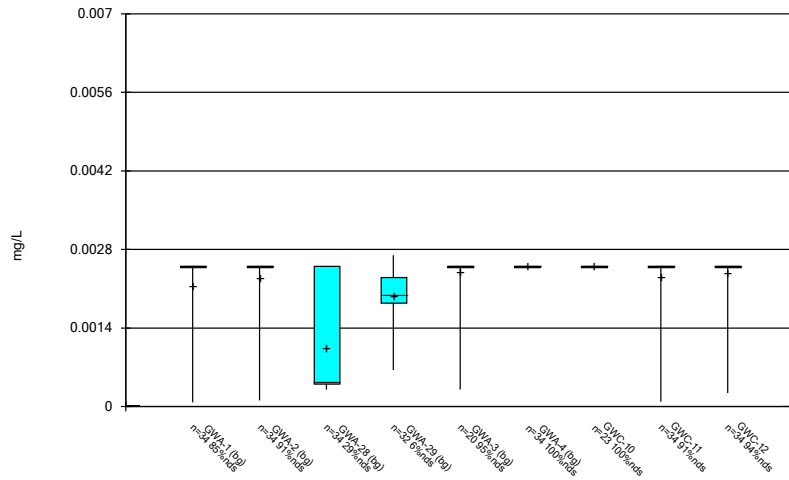

Constituent: Barium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

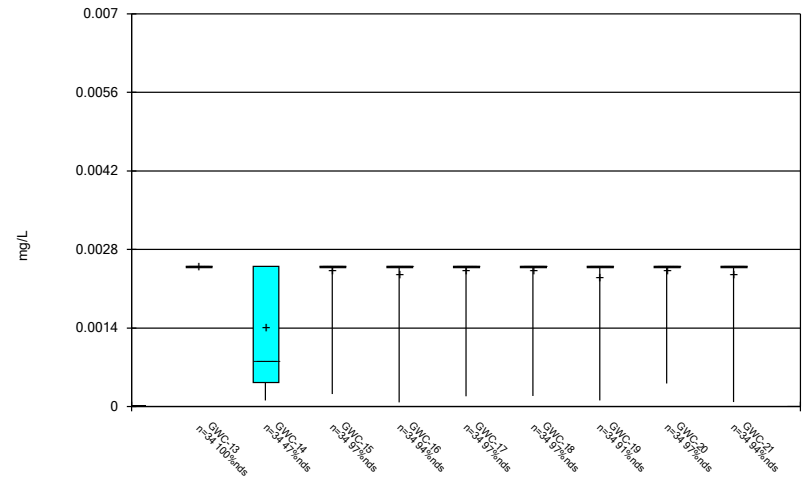

Constituent: Barium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

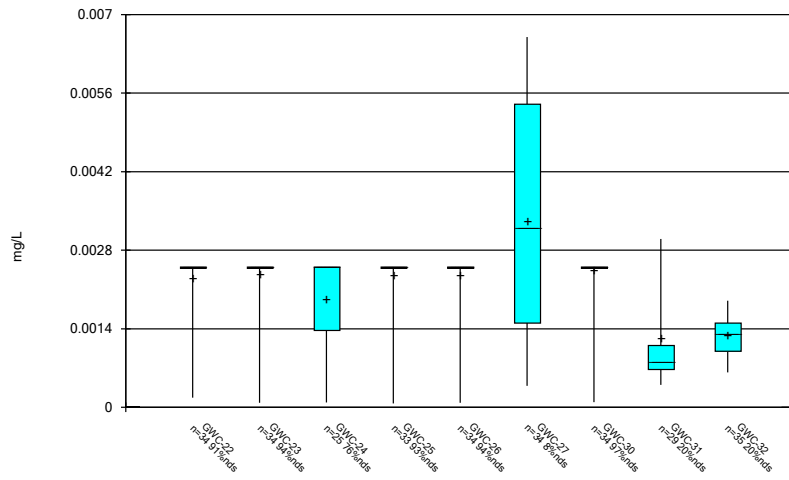

Constituent: Beryllium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

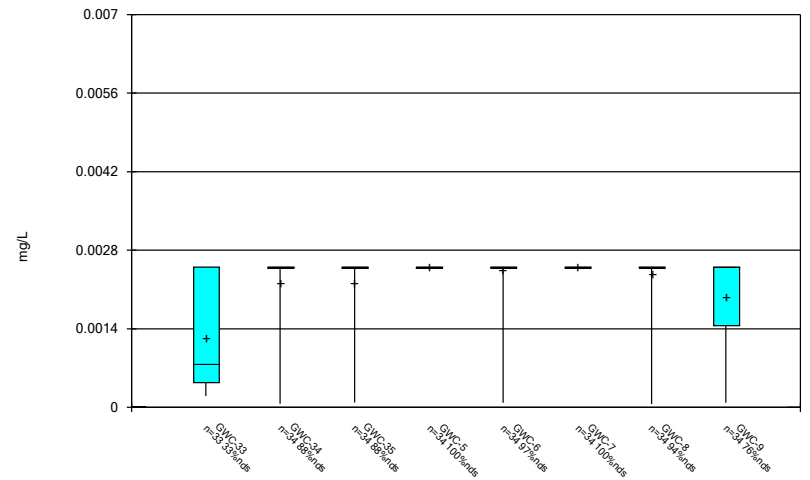

Constituent: Beryllium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Beryllium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Beryllium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

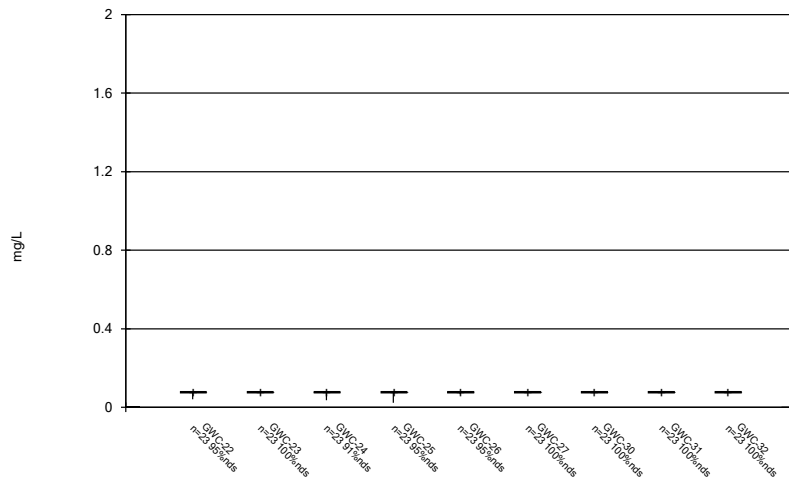

Constituent: Boron Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

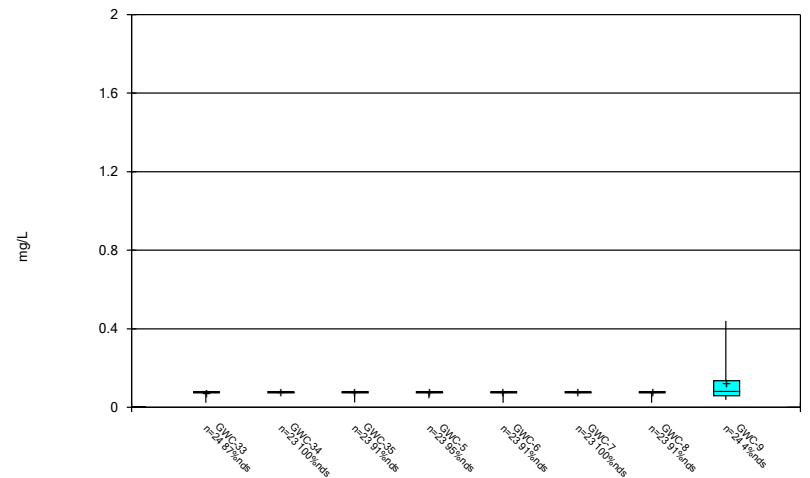

Constituent: Boron Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

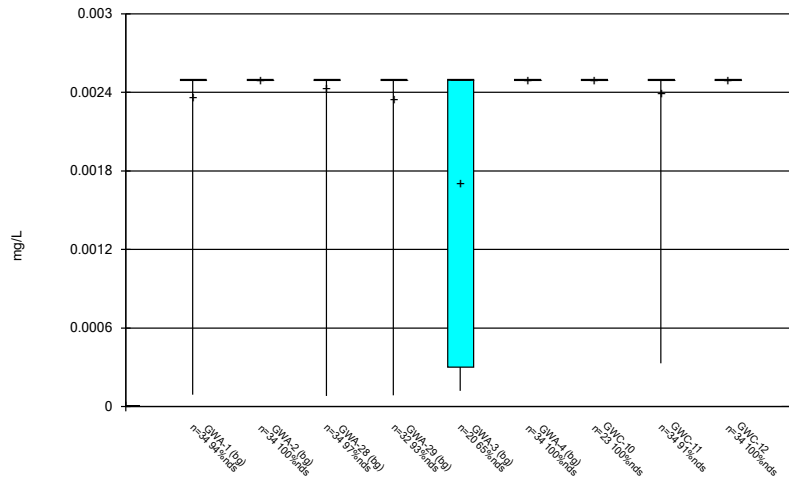

Constituent: Boron Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

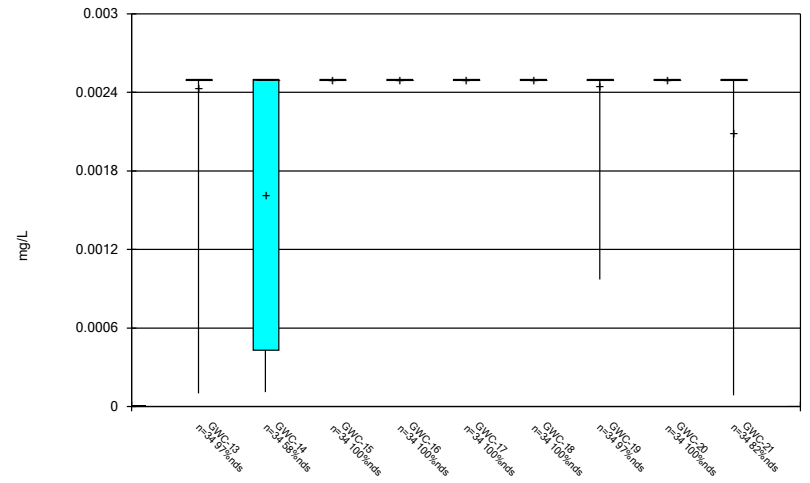

Constituent: Boron Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

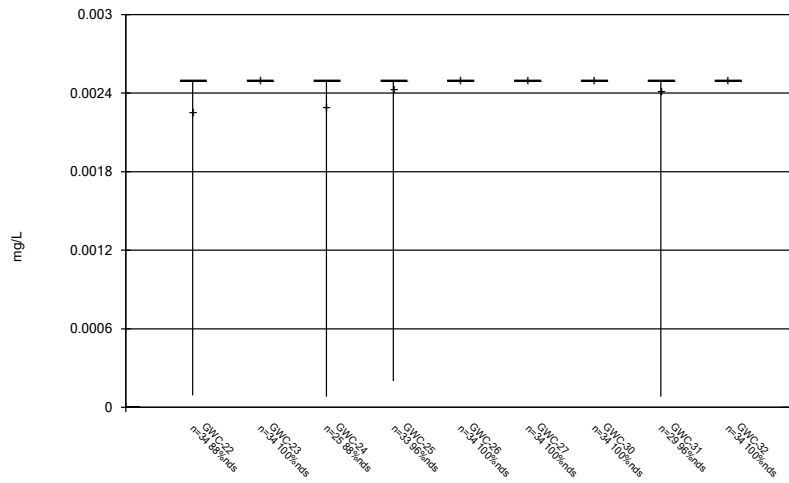

Constituent: Cadmium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

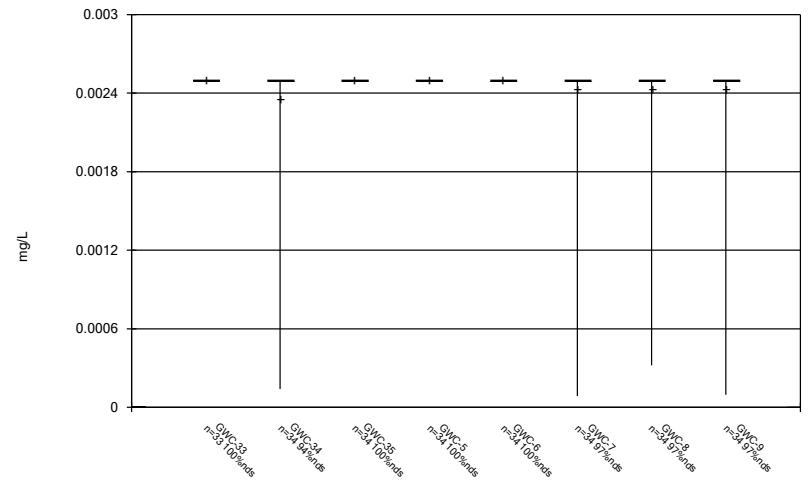

Constituent: Cadmium Analysis Run 10/17/2023 9:29 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

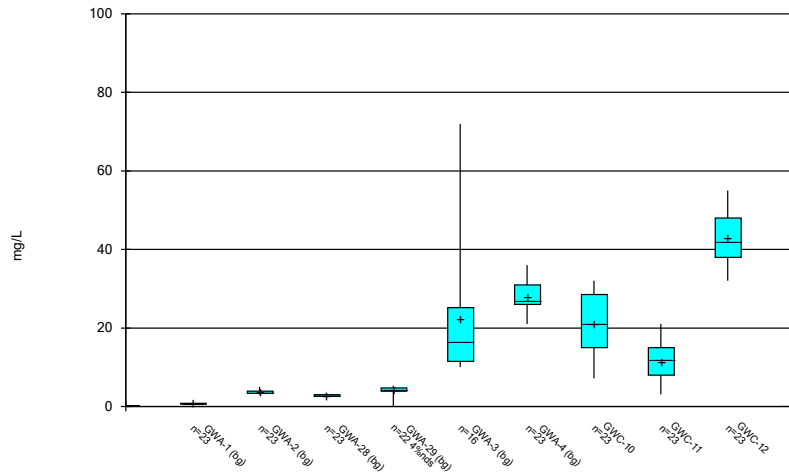

Constituent: Cadmium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

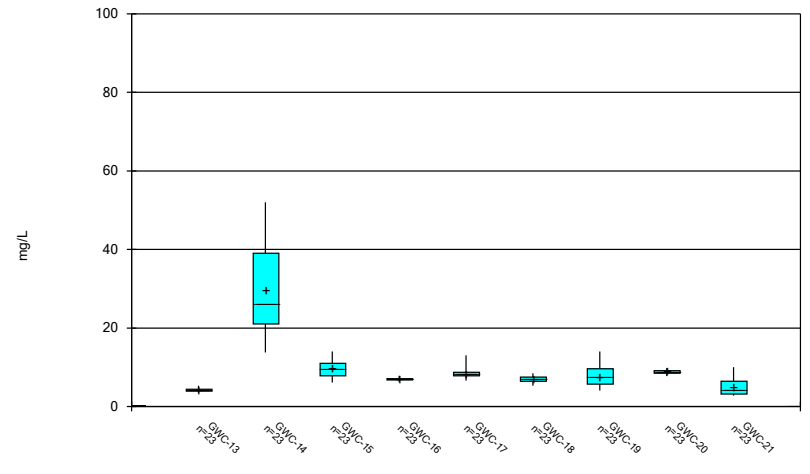

Constituent: Cadmium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Calcium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Calcium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Calcium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Calcium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Chloride Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Chloride Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Chloride Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Chloride Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

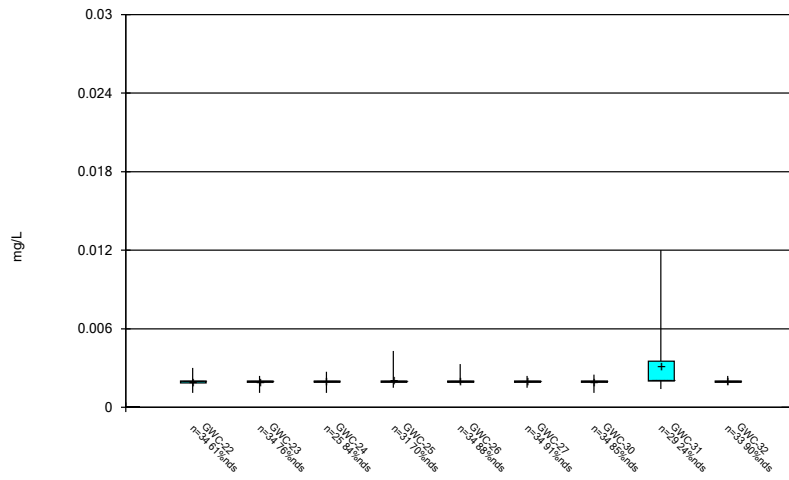

Constituent: Chromium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

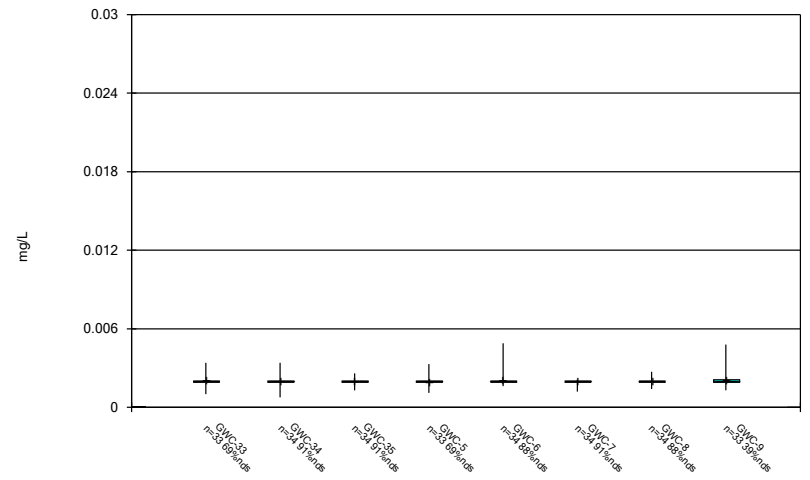

Constituent: Chromium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

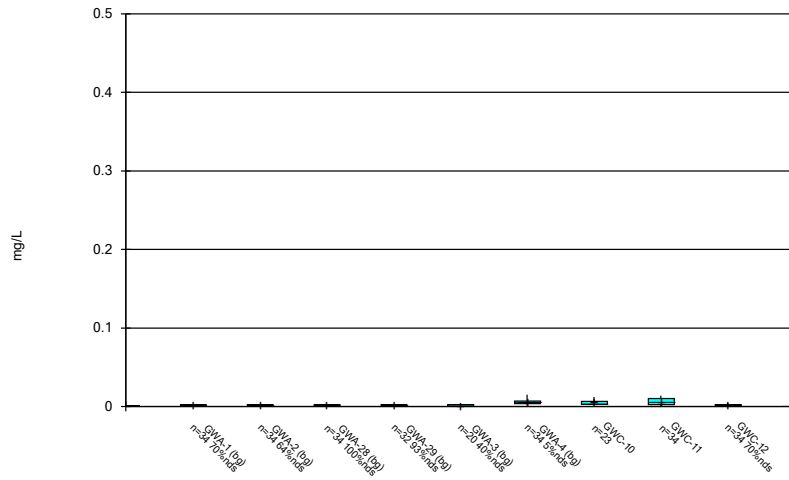

Constituent: Chromium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

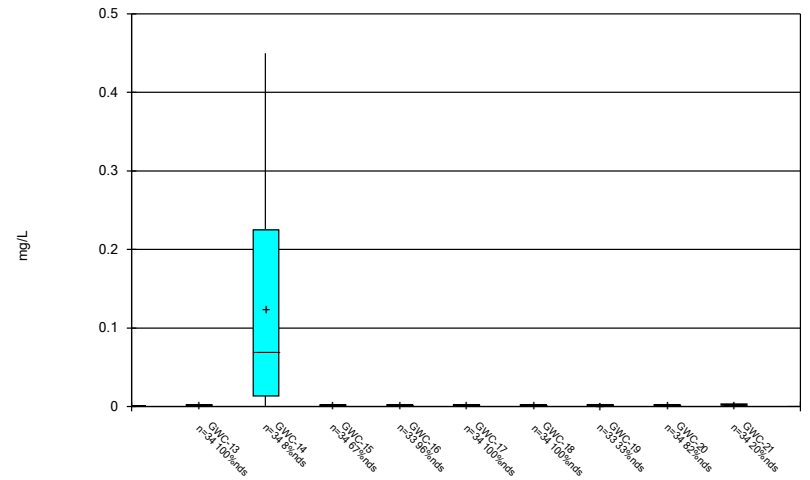

Constituent: Chromium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Cobalt Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Cobalt Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Cobalt Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Cobalt Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Copper Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Copper Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Copper Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Copper Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

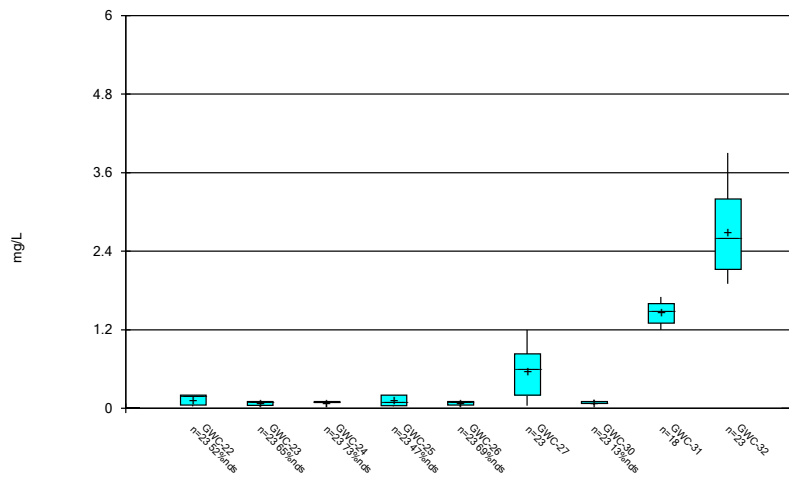

Constituent: Fluoride Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

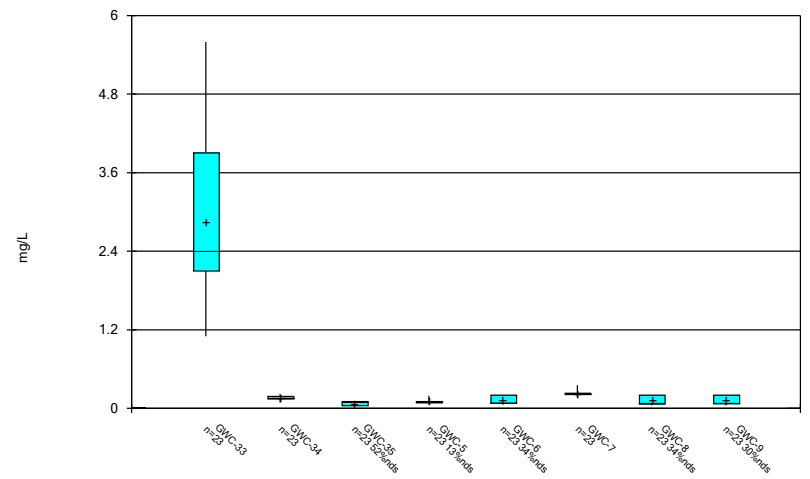

Constituent: Fluoride Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

Constituent: Fluoride Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

Constituent: Fluoride Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

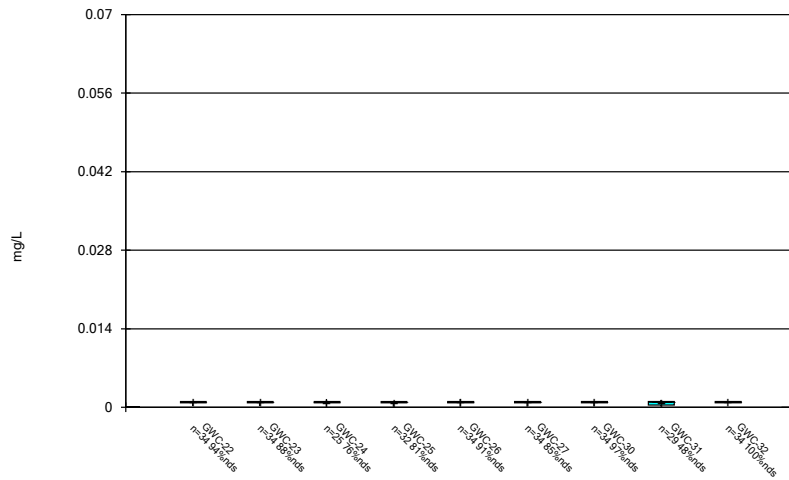

Constituent: Lead Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

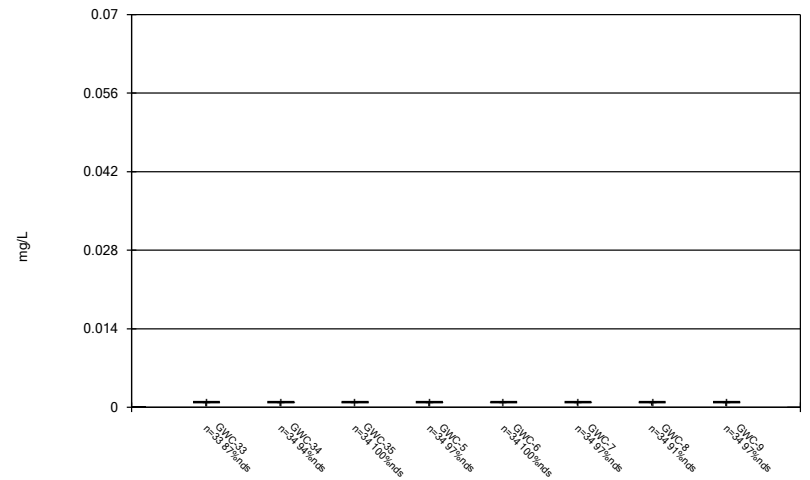

Constituent: Lead Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

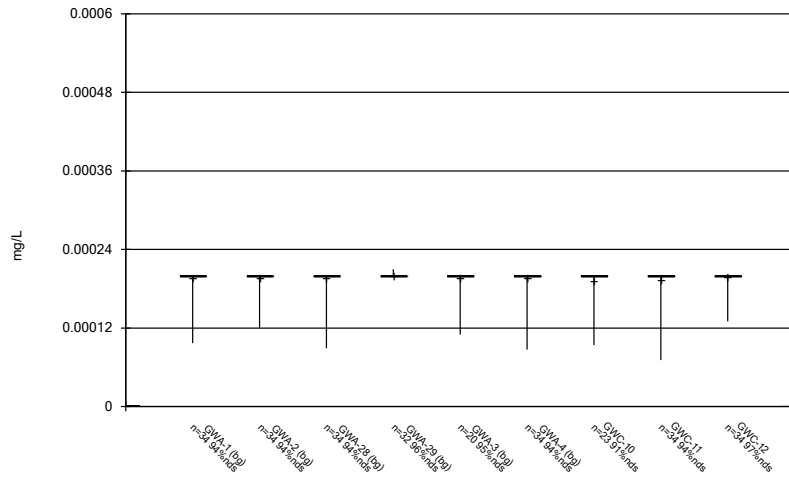

Constituent: Lead Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

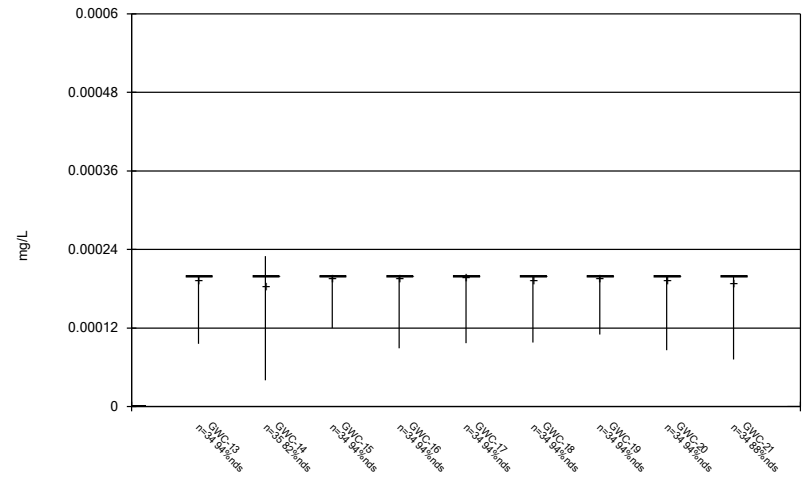

Constituent: Lead Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Mercury Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Mercury Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Mercury Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Mercury Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Nickel Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Nickel Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Nickel Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Nickel Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

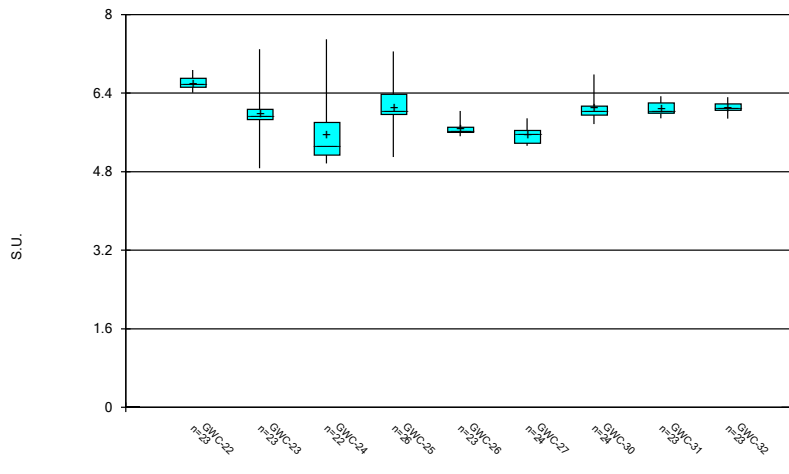

Constituent: pH, Field Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

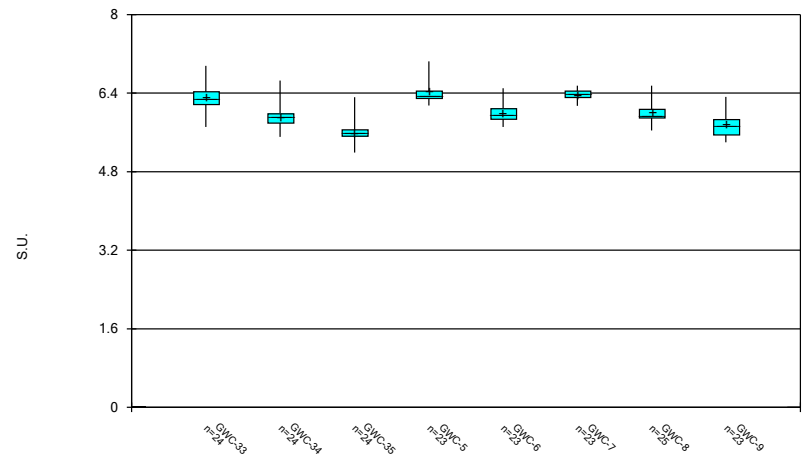

Constituent: pH, Field Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

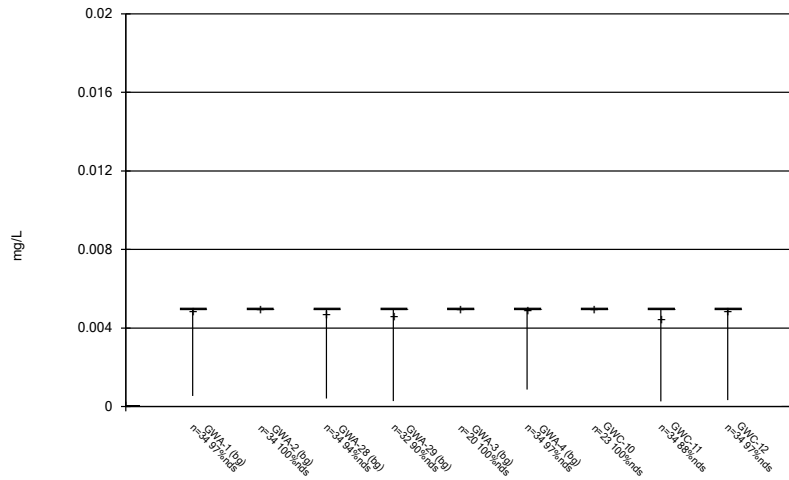

Constituent: pH, Field Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Box & Whiskers Plot

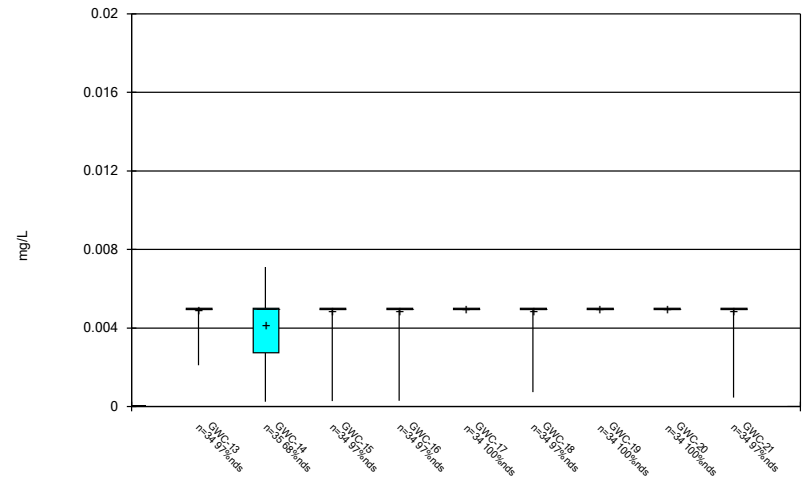

Constituent: pH, Field Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Selenium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Selenium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Selenium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Selenium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Silver Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Silver Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Silver Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Silver Analysis Run 10/17/2023 9:30 AM  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Sulfate as SO4 Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Sulfate as SO4 Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Sulfate as SO4 Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Sulfate as SO4 Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Thallium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Thallium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Constituent: Thallium Analysis Run 10/17/2023 9:30 AM  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Box & Whiskers Plot

Within Limit

### Prediction Limit Interwell Non-parametric

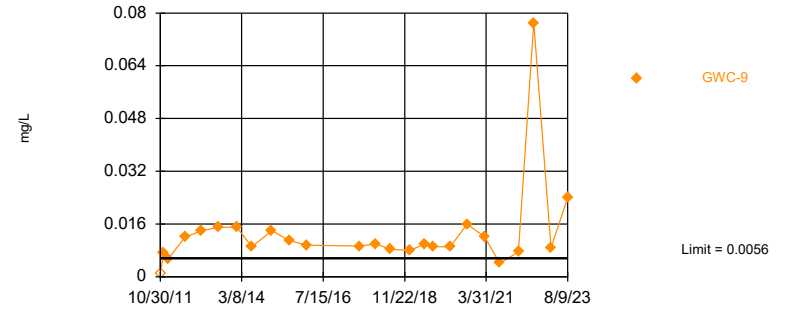

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 188 background values. 12.77% NDs. Annual per-constituent alpha = 0.003225. Individual comparison alpha = 0.00005569 (1 of 2). Comparing 2 points to limit. Assumes 27 future values.

Plant Wansley Client: Southern Company Data: Wansley Landfill

Exceeds Limit: GWC-9

### Prediction Limit Interwell Non-parametric

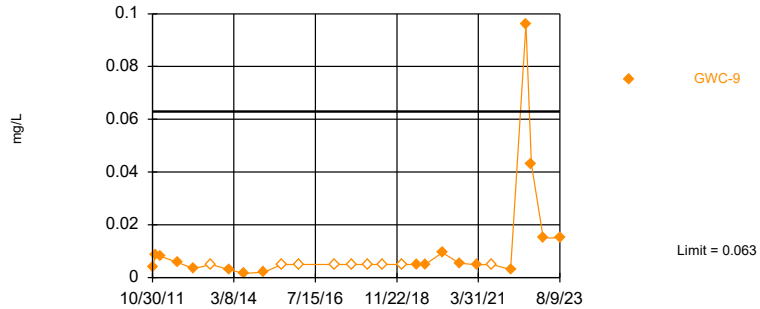

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 149 background values. 44.3% NDs. Annual per-constituent alpha = 0.005111. Individual comparison alpha = 0.00008834 (1 of 2). Assumes 28 future values.

Constituent: Nickel Analysis Run 9/25/2023 12:25 PM View: Appendix I - Two-Step  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Hollow symbols indicate censored values.

Within Limit

### Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 148 background values. 23.65% NDs. Annual per-constituent alpha = 0.005176. Individual comparison alpha = 0.00008947 (1 of 2). Assumes 28 future values.

Exceeds Limit: GWC-14, GWC-9

Prediction Limit  
Interwell Non-parametric

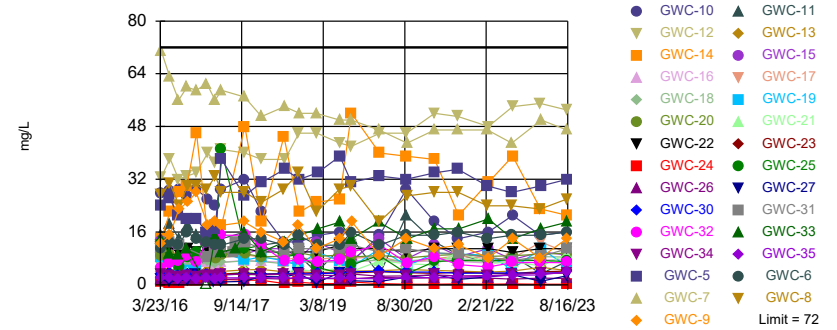

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 131 background values. 97.71% NDs. Annual per-constituent alpha = 0.006594. Individual comparison alpha = 0.0001141 (1 of 2). Comparing 29 points to limit.

Constituent: Boron Analysis Run 9/25/2023 12:52 PM View: Appendix III - Interwell  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Within Limit

Prediction Limit  
Interwell Non-parametric

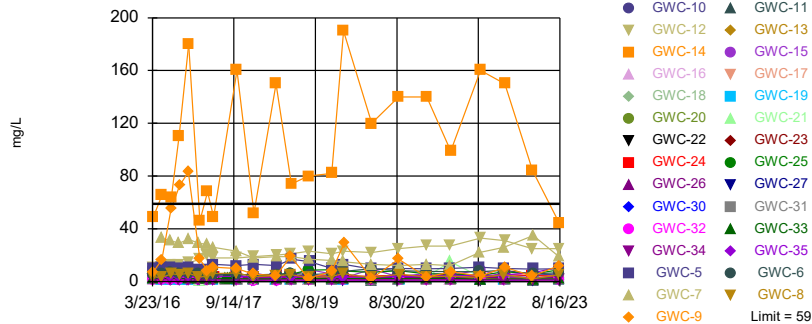

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 130 background values. 0.7692% NDs. Annual per-constituent alpha = 0.006693. Individual comparison alpha = 0.0001158 (1 of 2). Comparing 29 points to limit.

## ALTERNATE SOURCE DEMONSTRATION – 2023 ADDENDUM

## CERTIFICATION STATEMENT

I hereby certify that the information used in this alternate source demonstration for the coal combustion residuals (CCR) Unit located at Georgia Power's Plant Wansley located at 1371 Liberty Church Road, Carrollton, Georgia, and designated as the Coal Combustion By-Product Disposal Facility, is accurate pursuant to the requirements of 40 CFR §257.94(e)(2). I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management, and 40 CFR Part 258.50(g).

## 1.0 Introduction

This Alternate Source Demonstration (ASD) Addendum report has been prepared to address statistically significant increases (SSIs) identified in the groundwater monitoring network at the Georgia Power Company (GPC) – Plant Wansley CCR Landfill (the Site) following the second semiannual detection monitoring event of 2022. This ASD Addendum also provides additional data in support of the ASDs submitted to Georgia Environmental Protection Division (EPD) in 2018 (ACC, 2018) and 2022 (ACC, 2022), included as Attachment A. This ASD addendum has been prepared pursuant to 40 CFR 257.94(e)(2).

The Site, located in northeast Heard County and southeast Carroll County, Georgia, is comprised of three cells within an approximate 73-acre footprint (Figure 1). The landfill is permitted to operate by the Georgia EPD Solid Waste Handling Permit No. 074-005D(CCR). However, the sampling and reporting for the second semiannual detection monitoring event of 2022 was in accordance with the previous Solid Waste Permit 074-005D(LI) for the Site which was in effect at the time.

In October 2017, a semiannual detection monitoring event was conducted at the Site (ERM, 2018) in accordance with the United States Environmental Protection Agency (USEPA) CCR rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 Federal Register 21302-21501, April 17, 2015). As a result of the statistical analysis, SSIs were identified, and subsequently addressed by the 2018 ASD for the following constituents:

- Boron: GWC-9 and GWC-14
- Chloride: GWC-14
- Fluoride: GWC-32

Since submittal of the 2018 ASD, SSIs are no longer present in groundwater data for GWC-9 (boron) and GWC-32 (fluoride). The concentration of boron in GWC-9 has since returned below the site prediction limit and has exhibited a stable or decreasing trend since March 2020. Similarly, the concentration of fluoride in GWC-32 has returned below the site prediction limit and has exhibited a stable or decreasing trend since January 2018. As described in the 2018 ASD (Attachment A), both SSIs for GWC-9 and GWC-32 were due to a source other than the CCR landfill. At that time there was no waste placement near those wells and SSIs were attributed to natural variations observed in groundwater because of drought conditions (GWC-9) and natural occurrence in rock (GWC-32). Because these are no longer SSIs, natural variability is indicated. The SSIs for GWC-14 (boron and chloride) are still present and the 2018 ASD applies.

An addendum to the 2018 ASD was submitted in August 2022. Both the 2018 ASD and the August 2022 ASD Addendum were approved by EPD on October 19, 2022. The August 2022 ASD Addendum addressed SSIs for the following constituents:

- Boron: GWC-14 and GWC-15

- Chloride: GWC-14

In August 2022, a semiannual detection monitoring event was conducted at the Site in accordance with 40 CFR §257 Subpart D. The monitoring data were submitted for statistical analysis (Groundwater Stats Consulting - GSC, 2023). Based on the statistical results, an SSI (a significant upward trend) was identified for barium in the sample from GWC-14. Additionally, verification sampling was conducted in November 2022, and an additional SSI was identified for boron in the sample from GWC-12 (see Figure 2 for well locations). The newly verified SSIs identified during the August 2022 monitoring event are:

- Barium: GWC-14
- Boron: GWC-12

These two SSIs are the subject of this Addendum.

## 2.0 Alternate Source Demonstration

This ASD Addendum builds on information provided in the 2018 ASD and 2022 ASD Addendum (included as Appendix A) and demonstrates that the landfill is not the source of the SSIs at GWC-12 (boron) and GWC-14 (barium). The following sections provide specific demonstrations to support that the apparent source of the SSIs at GWC-12 and GWC-14 is a failure of a joint in the return water piping system that occurred in 2014 and has subsequently been repaired.

### 2.1 SSI Identification

Statistical analysis by GSC of the August 2022 groundwater monitoring event data identified one Appendix I analyte SSI, barium, for GWC-14 that was not previously addressed by an ASD. Barium at GWC-14 was also identified as having a significant upward trend. Historical results for this parameter are elevated compared to background; therefore, it has been evaluated by trend tests in lieu of prediction limits.

Statistical analysis (GSC, 2023) of the August 2022 groundwater monitoring event data identified an Appendix III analyte SSI in GWC-12. Boron was detected at a concentration of 0.088 milligrams per liter (mg/L), slightly above the statistically derived site prediction limit of 0.080 mg/L. A verification resample was collected for boron in November 2022 which verified the SSI at a concentration of 0.098 mg/L.

### 2.2 Data Review

The concentration range for barium at GWC-14 was identified as an increasing trend during the August 2022 sampling event. However, since the September 2019 sampling event, barium concentrations at GWC-14 have been decreasing. Concentrations of barium at GWC-14 range from non-detect (ND) to 0.32 mg/L as shown on Figure 3. GWC-14 was sampled on February 17, 2023, for the 2023 semiannual groundwater sampling event. The concentration of barium for that sampling event was 0.17 mg/L which is below the site prediction limit. Concentrations of barium have always been well below the USEPA maximum contaminant level (MCL) of 2.0 mg/L.

The low-level boron detections at GWC-12 have been variable during monitoring events ranging from ND to 0.11 mg/L as shown in Figure 4. GWC-12 was sampled on February 15, 2023, for the 2023 semiannual groundwater sampling event. The concentration of boron for that sampling event is an estimated “J” value of 0.077 mg/L, which is below the site prediction limit and illustrates the low-level nature of boron concentrations in GWC-12. There is no MCL established for boron, but concentrations of boron in GWC-12 have been well below the USEPA Regional Screening Level of 4.0 mg/L. February 2023 laboratory analytical data reports J230703-1 and J230803-1 are provided in Appendix B.

### 2.3 Alternate Source Review

Because the CCR Unit has a high-density polyethylene (HDPE) liner and leachate collection system, it is unlikely that the CCR Unit is the source of groundwater impact

at GWC-12 and GWC-14. Therefore, the potential for alternate source(s) has been evaluated.

Groundwater monitoring well GWC-14 is located both downhill and downgradient from the return water pond, return water pumps, and electrical control building. Groundwater monitoring well GWC-12 is located approximately 530 feet northwest of the return water pond, return water pumps, and electrical control building. The locations of both monitoring wells are depicted in Figure 2. Leachate is transferred from the return water pond through the return water dual walled pipes to the plant for operational purposes. Outside of the return water pond's double-liner system, piping is dual contained within two 16-inch diameter HDPE pipes that reside within 30-inch HDPE carrier pipes. Return water is pumped from the clear pool into the two dual contained pipes, then it exits the permitted site boundary on its return to the plant for reuse.

As described in the 2022 ASD Addendum, on August 30, 2014, an aboveground expansion joint on the return water pipe failed. The expansion joint served as a fail-safe measure to ensure the pipes themselves remained intact. Figure 5 illustrates the approximate location of the failure relative to groundwater wells GWC-12 and GWC-14. The facility made immediate and long-term repairs. The pond and piping are now fully repaired and functional. Additionally, the pump station has been moved to the edge of the return water pond, so in the occurrence of a future pumping failure or leak, the release would drain back into the pond.

The dataset observed for GWC-12 and GWC-14 is consistent with a one-time, transient event resulting from a discrete mechanical failure. The aboveground flow from the joint failure was downhill towards GWC-14 where it was first detected and was demonstrated in the 2022 ASD Addendum. The pipe failure occurred in August 2014, and the concentration of barium in GWC-14 started to increase in January 2015. As previously established, GWC-14 is directly downgradient of the expansion pipe failure. An increasing trend for barium reached a peak in September 2019, and concentrations have begun to decline since then. Declining trends are further evidenced by the February 2023 groundwater sampling event in which barium was detected at a concentration of 0.17 mg/L, which is less than the maximum barium concentration of 0.32 mg/L from September 2019 and is below the site prediction limit of 0.18 mg/L.

After a thorough review of historical groundwater elevations and flow directions, including utilizing data from older borings which have since been abandoned, there is evidence that GWC-12 is tangentially downgradient of the mechanical joint failure location shown on Figure 5. Figure 6, which is adapted from the Wansley Site Acceptability Report (GPC, 2007), lends insight into historical groundwater elevations beneath the footprint of the landfill. Groundwater elevations observed at wells GS-28 and GS-21 show a "saddle" of high groundwater elevations trending from the southwest to northeast, dipping to lower groundwater elevations to the northeast. Groundwater in the vicinity of well GS-21 exhibits a radial flow pattern as shown on Figure 6.

Design and Operation (D&O) Plan Sheet H1C11136, included as Figure 7, further displays a saddle of high groundwater elevation at Section D-D. This cross-section is located near GWC-12 and the return water pond area. This saddle of high groundwater and the requirement of EPD's Site Limitations to ensure five feet of separation from seasonal high groundwater and the landfill's base liner system influenced the design grades of the landfill. To achieve the required separation of groundwater, the landfill floor was designed with an elevated ridge dividing the landfill into Cell 1 and Cell 2. The wide section of elevated landfill floor exists, by design, directly above ridge of high groundwater elevation. The ridge of elevated cell floor extends from southwest to northeast, dividing the entire landfill, before merging into the grading pattern for the cell edge near the current North Sedimentation Pond and the Return Water Pond.

The high elevation divide between the landfill cells likely continues to influence the elevation of groundwater underneath the landfill. This ridge of high groundwater terminates at the northern edge of the landfill near the north sedimentation pond and the return water pond. A fan-shaped, radial pattern of groundwater flow is expected and demonstrated, as shown in Figure 6.

The published groundwater flow velocity in the 2022 Annual Groundwater Monitoring and Corrective Action Report at the site is 0.48 feet per day or 176 feet per year (ACC, 2023). The distance between the expansion joint failure and GWC-12 is approximately 530 feet. Thus, if GWC-12 were directly downgradient of the expansion joint failure and groundwater flow velocity remained consistent, it would take approximately 3 years for groundwater to move from the joint failure to GWC-12. However, GWC-12 is located tangentially downgradient from the joint failure and factors like soil adsorption, dilution, and soil heterogeneity would alter travel times.

Some effects of the release are being detected at low-level concentrations at GWC-12. Due to the steepness of the slope at the pipe rupture, likely nominal infiltration occurred, and due to the spatial location of GWC-12, there has been minimal impact to groundwater (as demonstrated by the low concentrations on Figure 4). Review of historical and current boring logs for GS-21, GS-22, and GWC-12 show layers of either poorly graded sandy gravel or layers of hard rock schist with regular fractures. These layers are found in between layers of clays and silts and/or competent rock. Both layers could potentially focus nominal groundwater flow from the expansion joint failure to GWC-12. The alternating geological layers would also alter groundwater travel times. Boring logs for GS-21, GS-22, and GWC-12 are included in Appendix C.

The initial prediction limit exceedance of boron at GWC-12 was 0.11 mg/L and occurred on March 7, 2022, approximately 7.5 years since the initial pipe failure. However, a subsequent verification event conducted on May 3, 2022, did not confirm the results. The concentration of boron at GWC-12 on August 16, 2022 (0.088 mg/L) was confirmed to be an SSI following a subsequent verification event conducted on November 29, 2022. Consequently, verified boron detections at GWC-12 occurred approximately 8 years from the initial pipe failure. GWC-12 was sampled on February 15, 2023, for the 2023 semiannual groundwater sampling event. The concentration of boron for that sampling event is an estimated "J" value of 0.077 mg/L, which is

below the site prediction limit and illustrates the low-level nature of boron concentrations in GWC-12.

A review of Plant Wansley Ash Pond 1 data shows that the site background concentrations for boron at the Ash Pond is 0.10 mg/L (Geosyntec, 2023). This background concentration is higher than the site background concentration for boron at the Site which is 0.080 mg/L. This demonstrates that background concentrations of boron at Plant Wansley, while low-level, are variable. The four most recent samples of boron for GWC-12 were below the site background at Ash Pond 1 and the most recent boron concentration data from GWC-12 (February 2023) was below the site prediction limit.

The distance, radial groundwater flow pattern, the potential for focused nominal groundwater flow from the expansion joint failure to GWC-12, altered travel times through geologic layer heterogeneity, and relatively slow groundwater velocity (176 feet per year) demonstrates why boron levels associated with the joint failure were detected at GWC-12 several years after the expansion joint failed. As discussed above, due to the steepness of the slope where the discharge occurred, there was likely nominal infiltration to groundwater. Furthermore, there are only low-level concentrations of boron at GWC-12. The difference in site background concentrations of boron between Ash Pond 1 and the Site demonstrates that background concentration of boron at Plant Wansley are variable. Due to the repairs and enhanced protocols for containment, it is anticipated that there will continue to be a stable or declining trend at GWC-12. Stability and declining trends are further evidenced by the February 2023 groundwater sampling event (a “J” value of 0.077 mg/L) which is an estimated boron concentration below the prediction limit in GWC-12.

## **2.4 Summary**

The landfill is not a source of the SSIs at GWC-12 and GWC-14 based on the landfill having an HDPE liner and observations made as part of the 2018 ASD, the 2022 ASD Addendum, and this ASD Addendum. The apparent source is a failure in 2014 of an expansion joint on the return water piping that occurred outside of the lined area, and was immediately addressed. In 2017, the facility completed enhancements to the return water pond and associated infrastructure that will prevent similar events from occurring in the future. These repairs will allow barium and boron concentrations to return to background levels, which may already be occurring as indicated by the February 2023 groundwater sampling event results, which shows the concentration of barium at GWC-14 and boron at GWC-12 below the site prediction limits.

The concentrations of barium at GWC-14 are declining as shown from the February 2023 groundwater sampling event data in which barium was detected at a concentration of 0.17 mg/L, which is less than the maximum barium concentration of 0.32 mg/L from September 2019, and is below the site prediction limit of 0.18 mg/L. The difference in the background concentration between Ash Pond 1 (0.10 mg/L) and the Landfill (0.080 mg/L) at Plant Wansley displays the variability of boron concentrations at Plant Wansley. The four most recent samples of boron were below the sitewide background at Ash Pond 1 and the most recent sample concentration

(February 2023) was below site prediction limit. The low groundwater velocity at the Site, radial groundwater flow direction, the potential for focused nominal groundwater flow from the expansion joint failure to GWC-12, altered travel times through geologic layer heterogeneity, and location of GWC-12 being tangentially downgradient from the expansion pipe failure area explains the time lag between the expansion joint failure and SSIs at GWC-12 several years after the initial piping failure occurred and the more immediate SSIs at GWC-14.

### 3.0 Conclusions and Recommendations

The Plant Wansley Landfill August 2022 Statistical Analysis report identified new SSIs for two groundwater monitoring locations: GWC-12 (boron) and GWC-14 (barium). This ASD addendum has identified the following sources for each location with an SSI:

- GWC-12 (boron)
  - A source other than the CCR unit caused the boron SSI (operational issue and repair)
  
- GWC-14 (barium)
  - A source other than the CCR unit caused the barium SSI (operational issue and repair)

All locations have met the requirements for a demonstration listed in §257.94(e)(2). Therefore, all locations should remain in detection monitoring at this time. Detection monitoring results will continue to be presented in the Semiannual and Annual Groundwater Monitoring and Corrective Action Reports.

Appendix A – Alternate Source Demonstration for Plant Wansley CCR Landfill (April 2018)

## 1.0 Introduction

This Alternate Source Demonstration (ASD) Addendum report has been prepared to address statistically significant increases (SSIs) identified in the groundwater monitoring network at the Georgia Power Company (GPC) – Plant Wansley CCR Landfill (the site) following the first semiannual detection monitoring event of 2022. This ASD Addendum also provides additional data in support of the ASD submitted to Georgia Environmental Protection Division (EPD) in 2018 (ACC, 2018). The complete 2018 ASD is provided as Attachment A. This ASD addendum has been prepared pursuant to 40 CFR 257.94(e)(2).

The site, located in northeast Heard County and southeast Carroll County, Georgia, is comprised of three cells within an approximate 73-acre footprint (Figure 1). The landfill is permitted to operate by the Georgia EPD [Solid Waste Handling Permit No. 074-005D(LI)].

In October 2017, a semiannual detection monitoring event was conducted at the site (ERM, 2018) in accordance with the United States Environmental Protection Agency (USEPA) CCR rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR21302-21501, April 17, 2015). As a result of the statistical analysis, SSIs were identified, and subsequently addressed by the 2018 ASD for the following constituents (see Figure 2 for well locations):

- Boron: GWC-9 and GWC-14
- Chloride: GWC-14
- Fluoride: GWC-32

Since submittal of the 2018 ASD, SSIs are no longer present in groundwater data for GWC-9 (boron) and GWC-32 (fluoride). The concentration of boron in GWC-9 has since returned below the site prediction limit and has exhibited a stable or decreasing trend since March 2020. Similarly, the concentration of fluoride in GWC-32 has returned below the site prediction limit and has exhibited a stable or decreasing trend since January 2018. As described in the 2018 ASD (Attachment A), both SSIs for GWC-9 and GWC-32 were due to a source other than the CCR landfill. At that time there was no waste placement near those wells and SSIs were attributed to natural variations observed in groundwater because of drought conditions (GWC-9) and natural occurrence in rock (GWC-32). Because these are no longer SSIs, natural variability is indicated. The SSIs for GWC-14 (boron and chloride) are still present and the 2018 ASD applies.

In March 2022, a semiannual detection monitoring event was conducted at the site in accordance with 40 CFR §257 Subpart D. The monitoring data were submitted for statistical analysis (Groundwater Stats Consulting - GSC, 2022). Based on the statistical results and verification sampling conducted in May 2022, an additional SSI was identified for boron in the sample from GWC-15. The verified SSIs identified during the March 2022 monitoring event are:

- Boron: GWC-14 and GWC-15
- Chloride: GWC-14

These three SSIs are the subject of this Addendum.

## 2.0 Alternate Source Demonstration

This ASD builds on information provided in the 2018 ASD and demonstrates that the landfill is not the source of the SSIs at GWC-14 (boron and chloride) and GWC-15 (boron). The following sections provide specific demonstrations to support that the apparent source of the SSIs at GWC-14 and GWC-15 is a failure of a joint in the return water piping system that occurred in 2014 and has subsequently been repaired.

### 2.1 SSI Identification

Statistical analysis by GSC from the March 2022 groundwater monitoring event identified two Appendix III analyte (boron and chloride) SSIs for GWC-14. The boron and chloride concentrations of 1.0 and 160 milligrams per liter (mg/L) were above the site prediction limits of 0.080 mg/L and 49 mg/L, respectively. A verification resample was collected for boron in May 2022 and the original result was verified at a concentration of 1.3 mg/L. A verification resample was not collected for chloride and therefore, it is considered an SSI. As noted in the 2018 ASD, boron and chloride were first identified as SSIs in GWC-14 in the 2017 Annual Groundwater Monitoring and Corrective Action Report (AGMCAR) (ERM, 2018).

Statistical analysis (GSC, 2022) from the March 2022 groundwater monitoring event also identified an Appendix III analyte (boron) SSI in GWC-15. Boron was detected at a concentration of 0.14 mg/L, slightly above the statistically derived site prediction limit of 0.080 mg/L. A verification resample was collected for boron in May 2022 which verified the SSI at a concentration of 0.13 mg/L. A third sample was collected and analyzed for boron in June 2022 as part of further evaluation of boron at GWC-15 and resulted in an estimated boron concentration of 0.067J mg/L (“J” flagged values are estimated concentrations between the laboratory’s method detection limit and practical quantitative limit), which is below the prediction limit of 0.080 mg/L.

The Plant Wansley Landfill February/March 2022 Statistical Analysis (GSC, 2022) also includes analysis of Appendix I metals which were not identified as SSIs.

### 2.2 Data Review

The concentration ranges for boron and chloride at GWC-14 have shown variability during monitoring. Concentrations of boron at GWC-14 range from 0.29 to 1.8 mg/L, and chloride ranges from 46 to 190 mg/L as shown on Figures 3 and 4. Boron time-series plots for GWC-14 and GWC-15 are shown on Figure 3, and chloride time-series plots for GWC-14 and GWC-15 are shown on Figure 4.

The low-level boron detections at GWC-15 have been variable during monitoring ranging from 0.047J to 0.14 mg/L as shown in Figure 3. Following the March and May 2022 sampling events, another sample was collected for boron in June 2022 resulting in an estimated “J” value of 0.067J mg/L, which is below the site prediction limit. The geometric mean of the boron data between 2016 and 2022 is 0.060 mg/L, also below the site prediction limit, and illustrates the low-level nature of boron concentrations in GWC-15.

### 2.3 Alternate Source Review

Because the CCR Unit has a High-Density Polyethylene (HDPE) liner and leachate collection system, it is unlikely that the CCR Unit is the source of groundwater impact at GWC-14 and GWC-15. Therefore, the potential for an alternate source(s) has been evaluated.

Groundwater monitoring well GWC-14 is located both downhill and downgradient from the return water pond, return water pumps, and electrical control building. Groundwater monitoring well GWC-15 is located approximately 370 feet southeast of GWC-14 and is also downhill and tangentially downgradient from the return water pond, return water pumps and associated piping, and electrical control building. The locations of both monitoring wells are depicted on Figure 2. Leachate is transferred from the return water pond through the return water dual walled pipes to the plant for operational purposes. Outside of the return water pond's double-liner system, piping is dual contained within two 16-inch diameter HDPE pipes that reside within 30-inch HDPE carrier pipes. Return water is pumped from the clear pool into the two dual contained pipes, then it exits the permitted site boundary on its return to the plant for reuse.

On August 30, 2014, an aboveground expansion joint on the return water pipe failed. The expansion joint served as a fail-safe measure to ensure the pipes themselves remained intact. Figure 5 illustrates the approximate location of the failure relative to groundwater wells GWC-14 and GWC-15, and groundwater flow direction. A picture of the expansion joint is presented in Exhibit 1, and photographs of the slope where the aboveground flow from the pipe occurred and of the repaired slope near GWC-14 are embedded below as Exhibit 2 and 3, respectively.

At the time of the expansion joint failure, Georgia EPD was immediately, verbally notified and subsequently provided written notification. GPC addressed the area by excavating affected embankment soils; however, the sampling results for GWC-14 and GWC-15 and the absence of other apparent explanation for those results indicates that some infiltration reached the water table and has ultimately affected the groundwater sampled at GWC-14, as documented in the 2018 ASD and, to a lesser extent, GWC-15.

*Exhibit 1 Expansion Joint Rupture of the Return Water Pipe*

*Exhibit 2 Vegetative Cover on the Embankment Northeast (Downhill) of the Return Water Pipe Rupture*

*Exhibit 3 Embankment Repair Uphill from GWC-14.*

The facility made immediate and long-term repairs. The pond and piping are now fully repaired and functional. Additionally, the pump station has been moved to the edge of the return water pond, so in the occurrence of a future pumping failure or leak, the release would drain back into the pond.

The dataset observed for GWC-14 and GWC-15 is consistent with a one-time, transient event resulting from a discrete mechanical failure. The aboveground flow from the joint failure was downhill towards GWC-14 where it was first detected. Some effect of the release is being detected, at low-level concentrations, at GWC-15. Due to the steepness of the slope at the pipe rupture, likely nominal infiltration occurred and due to the spatial location of GWC-15, there has been minimal impact to groundwater (as demonstrated by the low concentrations on Figure 3).

Furthermore, there have been no SSIs identified for boron and chloride at GWC-13, which is located approximately 326 feet northwest and tangentially upgradient of the joint failure area and GWC-14 (Figure 2). Because groundwater impact was first identified at GWC-14, then at GWC-15, and there is no associated impact at GWC-13, the cause would have to be downgradient (or cross gradient) to GWC-13, and upgradient of GWC-14 and GWC-15. The cause must also be closer to GWC-14 than GWC-15. The failure of the expansion joint of the return water line in 2014 satisfies these constraints for the alternate source.

The pipe failure occurred in August 2014 and the initial boron SSI for GWC-14 was confirmed in October 2017. As previously established, GWC-14 is directly downgradient of the expansion pipe failure; however, the initial boron SSI at GWC-14 was approximately three years after the pipe failure. While boron has been detected

at estimated values in GWC-15 since 2016, the time from the failure of the expansion joint to the initial, confirmed SSI (May 2022) was approximately 7.6 years.

The published groundwater flow velocity in the 2022 Semiannual Groundwater Monitoring and Corrective Action Report at the site is 0.46 feet per day or 168 feet per year (ACC, 2022). The distance between the expansion joint failure and GWC-15 is approximately 529 feet. Thus, if GWC-15 were directly downgradient of the expansion joint failure and groundwater flow velocity remained consistent, it would take approximately 3 years for groundwater to move from the joint failure to GWC-15. However, GWC-15 is located tangentially downgradient from the joint failure and factors like soil adsorption, dilution, and variable soil consistency may alter travel times.

The initial, relatively higher value of boron at GWC-15 was 0.1 mg/L and occurred on January 22, 2019, approximately 4.4 years since the initial pipe failure. The next higher value of boron at GWC-15 (0.14 mg/L) occurred on March 16, 2020, approximately 5.6 years since the initial pipe failure, and was identified as an initial prediction limit exceedance. However, a subsequent verification event conducted on May 4, 2020 did not confirm the results. The concentration of boron at GWC-15 (0.14 mg/L) on March 7, 2022 was confirmed to be an SSI following a subsequent verification event conducted on May 4, 2022. Therefore, verified, elevated boron detections at GWC-15 occurred approximately 7.6 years from the initial pipe failure and approximately 4.6 years after the initial boron SSI at GWC-14.

The distance and the relatively slow groundwater velocity demonstrates why boron levels associated with the joint failure were detected in GWC-15 after several years. As discussed above, due to the steepness of the slope where the discharge occurred, there was likely nominal infiltration to groundwater. Due to the spatial location of GWC-15, and relatively slow groundwater flow velocity, there are only low-level concentrations of boron at GWC-15. Due to the repairs and enhanced protocols for containment, it is anticipated that there will be a stable declining trend at GWC-15 and eventually at GWC-14. As GWC-14 is located closer to the expansion pipe failure, it most likely will be influenced by infiltration of the released return water from the expansion pipe failure for a longer period of time than GWC-15, which is located tangentially downgradient and further away from the pipe failure. Stability and declining trends are further evidenced by the June 2022 resampling event (0.067J mg/L) that resulted in an estimated boron concentration below the prediction limit in GWC-15.

## **2.4 Summary and Recommendations**

Based on the landfill having an HDPE liner and observations made as part of the 2018 ASD and this ASD addendum, the landfill is not a source of the SSIs at GWC-14 and GWC-15. The apparent source is a failure in 2014 of an expansion joint on the return water piping that occurred outside of the lined area, and was immediately addressed. In 2017, the facility completed enhancements to the return water pond and associated infrastructure that will prevent similar events from occurring in the future. These repairs will allow boron and chloride concentrations to return to background levels,

which may already be occurring as indicated by the June 2022 resampling of GWC-15 that resulted in a boron concentration below the prediction limit. Because GWC-14 is located closer to the expansion pipe failure, it most likely will be influenced by infiltration of the released return water from the expansion pipe failure longer than GWC-15. Thus, the anticipated declining trends for boron and chloride in GWC-14 may take longer to occur. The low groundwater velocity and tangentially downgradient location of GWC-15 at the site explains the time lag between the expansion joint failure, SSIs at GWC-14, and SSIs at GWC-15 several years after the initial piping failure occurred.

### 3.0 Conclusions and Recommendations

The Plant Wansley Landfill February/March 2022 Statistical Analysis report identified SSIs for two groundwater monitoring locations: GWC-14 (boron and chloride) and GWC-15 (boron). This ASD addendum has identified the following sources for each location with an SSI:

- GWC-14
  - A source other than the CCR unit caused the boron and chloride SSIs (operational issue and repair)
- GWC-15
  - A source other than the CCR unit caused the boron SSI (operational issue and repair)

All locations have met the requirements for a demonstration listed in §257.94(e)(2). Therefore, all locations should remain in detection monitoring at this time. Detection monitoring results will continue to be presented in the Semiannual and Annual Groundwater Monitoring and Corrective Action Reports.

# SECTION 1

## Introduction

This document presents an alternate source demonstration (ASD) for statistically significant increases (SSIs) as identified in the 2017 Annual Groundwater Monitoring and Corrective Action Report submitted on January 31, 2018. This ASD has been prepared pursuant to 40 CFR 257.94(e)(2), which states that “the owner/operator may demonstrate that a source other than the coal combustion residual (CCR) unit caused the statistically significant increase over background levels for a constituent or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality.”

Georgia Power Company (GPC) – Plant Wansley CCR Landfill (the site) is located in northeast Heard County and southeast Carroll County on Liberty Church Road, approximately 12 miles southeast of the City of Carrollton. The plant property encompasses approximately 5,100 acres and the landfill is permitted to operate by the Georgia Environmental Protection Division (EPD) [Permit No. 074-005D(L)(I)]. The disposal facility is comprised of three cells within an approximate 73-acre disposal footprint. Figure 1, Plant Wansley CCB Disposal Facility Site Location Map, depicts the site location referenced to regional landmarks. The facility has received only flue gas desulfurization gypsum waste from GPC – Plant Wansley to date; however, a recently approved permit modification will allow for all forms of CCR to be disposed in the future.

In accordance with the United States Environmental Protection Agency (USEPA) CCR rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR21302-21501, April 17, 2015), the facility prepared the *2017 Annual Groundwater Monitoring and Corrective Action Report* to document groundwater monitoring activities conducted at the site and satisfy the requirements of §257.90(e). Groundwater monitoring and reporting for the site is performed in accordance with the monitoring requirements §257.90 through §257.98. In that report, SSIs were identified as follows:

- Boron: GWC-9 and GWC-14
- Chloride: GWC-14
- Fluoride: GWC-32

---

---

## SECTION 2

### Alternate Source Demonstration

As allowed by §257.94(e)(2), the site may demonstrate that a source other than the CCR unit caused the SSI for a constituent or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. This report demonstrates an alternate source for SSIs of constituents included in Appendix III of 40 CFR. §257 identified following analysis of the first detection monitoring event data. SSIs were identified for three groundwater monitoring network wells (GWC-9, GWC-14, and GWC-32). Two of these locations (GWC-9 and GWC-14) were previously identified as having SSIs under state permitting requirements. The SSIs at these locations were addressed in an EPD-approved ASD completed in 2017. This ASD builds on information provided in the 2017 document to address the newly required Appendix III constituents. There are conditions unique to each individual well where one or more SSIs were identified at the site. Therefore, the following sections provide specific demonstrations, by well, to support that the site is not the source of the SSI. A recent potentiometric surface map is provided for reference as Figure 2, Plant Wansley CCB January 2018 Potentiometric Surface Map.

#### 2.1 GWC-9

##### 2.1.1 SSI Identification

One Appendix III analyte (boron) was identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as a SSI at this location. The concentration of 0.12 milligrams per liter (mg/L) reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limit of 0.05 mg/L. A verification resample was collected on December 1, 2017 and the exceedance was confirmed at a concentration 0.10 mg/L.

##### 2.1.2 Data Review

Background monitoring was initiated in 2016 and continued through 2017. As shown in Figure 3, Boron Time Series Plot for GWC-9, the concentration of boron was reported at trace levels during the initial rounds of background monitoring (estimated “J” values of 0.0635J and 0.0981J mg/L March and May 2016, respectively). An increase in concentration to 0.26 mg/L was reported in July 2016 and continued until reaching a maximum level of 0.44 mg/L in November 2016. The concentration declined to 0.11 mg/L in January 2017 and remained in a range of 0.071 to 0.12 mg/L for the duration of 2017. The well was most recently sampled in January 2018 as part of the first 2018 semi-annual monitoring event required by the current solid waste permit. The January 2018 concentration of 0.044J mg/L was less than the site prediction limit of 0.050 mg/L.

Other Appendix III parameter trends were reviewed in order to gain insight into the source of the boron increase and subsequent decline. Based on a review of these data, chloride, total

dissolved solids (TDS) and to a lesser extent calcium exhibit trends similar to boron. All of these analytes showed increases in late 2016 reaching maximum levels during the November 2016 event then subsequently declining to near the original early 2016 levels. Time series plots for these analytes are provided in Figure 4 (Chloride Time Series Plot for GWC-9), Figure 5 (TDS Time Series Plot for GWC-9) and Figure 6 (Calcium Time Series Plot for GWC-9).

Water level and precipitation data were also reviewed. The increasing analyte trends correspond to a period of relative drought. According to the National Oceanic and Atmospheric Administration (NOAA) the average annual precipitation for Carrolton, Georgia is 51.4 inches. The University Georgia College of Agricultural & Environmental Sciences maintains a statewide weather monitoring network including a Plant Wansley station. Data from the Plant Wansley station indicate that 2016 was a significantly drier than average year with total precipitation of 39.6 inches. Conversely, both 2015 and 2017 were wetter than average with respective totals of 60.2 and 69.7 inches. The period between September 19 and November 28, 2016 was notably dry in that no precipitation event greater than 0.1 inches occurred. As shown in Figure 7, Groundwater Elevation and Boron Time Series Plot for GWC-9, the dry weather during late 2016 coincides with lower water groundwater elevations and higher boron concentrations at GWC-9.

### **2.1.3 Alternate Source Review**

Based on a review of the facility's Design and Operation Plans and recent aerial photographs, direct leakage from the cell area is highly improbable. Very limited gypsum slurry has been directed into Cell 2 and the small amount that has been is located on the opposite side of the cell approximately 1200 feet from GWC-9. The landfill is a fully lined unit including a 60-mil thick high-density polyethylene (HDPE) liner underlain by a geosynthetic clay liner (GCL), a 6-inch layer of compacted clay (maximum permeability of  $1 \times 10^{-5}$  cm/sec), and structural fill. Two sedimentation basins and a return water pond capture all leachate, sluice water and storm water run-off generated in the lined cell areas.

Storm water runoff from the perimeter gravel road has occurred near GWC-9 (uphill from the pump booster station), as evidenced by erosion rills in the vicinity. The gravel road is not anticipated to be a significant source of impact; however, the road is serviced by water trucks used for dust suppression. During drought conditions present in 2016, the facility opted to minimize water usage from typical sources by utilizing water from the NPDES discharge pond (retention pond). Water from this pond has been treated prior to release. However, it may exhibit slightly different chemical characteristics than the dust suppression water used during non-drought conditions (i.e. potentially accounting for the boron and chloride increases and subsequent decline after the drought ended). An operational issue related to dust suppression is a potential source.

### **2.1.4 Natural Variation in Groundwater Quality**

As discussed in Section 2.1.2, an increasing trend in the concentrations of boron, chloride and TDS occurred during a period of relative drought in 2016. Concentrations diminished

during a return of wetter weather during 2017 Lower groundwater elevations have the potential to result in fluctuations in the concentrations of naturally occurring analytes (i.e. groundwater is less diluted by rainwater during periods of relative drought). As shown in Figure 7 there appears to be an inverse relationship between the groundwater elevation and boron concentration. Therefore, a natural variation in groundwater quality is also a potential source.

### **2.1.5 Summary and Recommendations**

The CCR unit is not the apparent source of the boron SSI. The lined landfill was constructed to prevent direct impact to groundwater and there is no waste in close proximity to the well. Dry weather conditions that occurred in 2016 indicate the possibility that a natural variation in groundwater quality occurred. Additionally, recent data indicate that conditions have returned to background levels and concentrations are no longer at SSI levels. The monitoring well should remain in detection monitoring as the assessment trigger is no longer present and an alternate source was identified.

## **2.2 GWC-14**

### **2.2.1 SSI Identification**

Two Appendix III analytes (boron and chloride) were identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as SSIs at this location. The respective concentrations of 0.95 and 160 mg/L for boron and chloride reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limits of 0.05 mg/L (boron) and 23 mg/L (chloride). A verification resample was collected on December 1, 2017 and the exceedances were verified at concentrations of 1.2 and 150 mg/L for boron and chloride, respectively.

### **2.2.2 Data Review**

The concentration ranges for boron and chloride have shown variability during monitoring. As shown in Figure 8, Boron Time Series Plot for GWC-14 and Figure 9, Chloride Time Series Plot for GWC-14, the range of boron concentrations is 0.29 to 1.2 mg/L and chloride 46 to 180 mg/L. However, even at the low end of the ranges the concentrations are above site background conditions.

### **2.2.3 Alternate Source Review**

Groundwater monitoring well GWC-14 is located directly downhill and downgradient from the return water pond, return water pumps, and electrical control building. Effluent is transferred from the return water pond to the return water lines that connect to the plant where it is recycled for operations.

There have been historical operational issues in this area. An unpermitted discharge due to the failure of an HDPE expansion joint on the return water pipe occurred on August 30, 2014. The Georgia Environmental Protection Division was immediately verbally notified and

subsequently provided written notification. The facility made immediate repairs and also began to evaluate long-term corrective actions. The pond was temporarily taken out-of-service to allow repairs to be made beginning in early 2015. The concrete headwall, HDPE liner and soil berm were removed to expose the buried return water piping leading from the return water pond to the pumps. Repairs to the piping, liner and headwall were completed in early 2017. The pond is now fully repaired and functional.

#### **2.2.4 Summary and Recommendations**

The CCR unit is not the direct source of the boron and chloride SSIs. The apparent source is a return water piping failure that was identified and addressed. The facility completed repairs to the return water pond and piping in 2017 that will prevent future releases from occurring and thus allowing boron and chloride concentrations to eventually return to background levels. The monitoring well should remain in detection monitoring as an alternate source was identified.

### **2.3 GWC-32**

#### **2.3.1 SSI Identification**

One Appendix III analyte (fluoride) was identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as a SSI at this location. The concentration of 3.4 mg/L reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limit of 3.2 mg/L. A verification resample was collected on December 1, 2017 and the exceedance was verified at a concentration of 3.4 mg/L.

#### **2.3.2 Data Review**

Concentrations of fluoride ranged from 2.1 to 3.9 mg/L in samples collected from GWC-32 during background monitoring. The concentrations reported during the compliance event and verification resample were within this range. Several nearby monitoring wells also produced consistent detections of fluoride (e.g. GWA-28, GWA-29, GWC-27, GWC-31 and GWC-33). Two of these locations, GWA-28 and GWA-29 are upgradient from Cell 3 and are used to characterize background conditions. Concentrations at these locations ranged from 1.4 to 3.2 mg/L during background monitoring. The site prediction limit of 3.2 mg/L was based on these data (i.e. maximum concentration reported in background).

Reported fluoride concentrations in multiple upgradient and downgradient wells at Cell 3, which has not yet been used for CCR disposal, are likely derived from a natural source in the underlying bedrock. The boring logs from these locations provided in Appendix A, Boring Logs, indicate that GWA-28, GWA-29, GWC-27, GWC-31, GWC-32, and GWC-33 are at least partially screened in a common lithology, the Long Island Creek Gneiss. This lithology is localized to this portion of Plant Wansley. Rock units encountered in other portions of the site include: biotite gneiss (easily differentiated from the Long Island Creek Gneiss by greater abundance of mafic minerals), quartzite, schist units and amphibolite units. As shown in Figures 1 and 2, these well locations are adjacent to each other. It is noted that

one location in this area, GWC-30 did not produce fluoride detections. However, this location is differentiated from the others in that it is screened in overburden rather than bedrock. A time series plot depicting fluoride concentrations at these locations is provided as Figure 10, Fluoride Time Series Plot for Cell 3 Monitoring Wells.

### 2.3.3 Alternate Source Review

Groundwater monitoring well GWC-32 is adjacent to Cell 3. This cell is not contiguous with Cells 1 and 2 and has never received waste. Therefore, the CCR unit is not the apparent source.

### 2.3.4 Natural Variation in Groundwater Quality

Based on the commonality of the localized lithology, the Long Island Creek Gneiss was identified as a potential source of fluoride in groundwater samples from GWC-32 and other nearby locations. Identification of a natural bedrock source of fluoride is supported by the following evidences from (A) fluoride analysis in rock samples and (B) the major ionic concentrations in groundwater for evaluation of the chemical composition of groundwater.

A. ACC obtained core samples from the plant and/or SCS storage of three distinct site lithologies: Long Island Creek Gneiss, schist/amphibolite and quartzite. Core sample fragments were shipped to TestAmerica Pensacola for analysis of fluoride by EPA Method 9056. It should be noted that this laboratory method only accounts for water soluble fluoride and not concentrations present in the rock matrix. The actual whole rock concentration of fluoride is likely to be much higher. The sample results are summarized in Table 1 and the laboratory analytical report is included in Appendix B, Laboratory Analytical Results & Purge Data Sheets.

**TABLE 1.** Rock sample fluoride concentrations.

Sample Identification	Fluoride Concentration (mg/Kg)
PB-3 Long Island Gneiss 56-57'	11
PB-4 Long Island Gneiss 49-50'	9.3
PB-8 Schist/Amphibolite 123-124'	<1.3
PB-9 Schist/Amphibolite 65-66'	3.4J
APC-5D Quartzite 90-91'	<1.3

Notes:

1. mg/Kg = milligrams per kilogram
2. "J" = reported concentration is less than laboratory reporting limit and considered estimated.

The results confirm that there is a significantly higher concentration of fluoride in the Long Island Creek Gneiss relative to other site lithologies that were analyzed. Therefore, wells screened in this unit may be more likely to produce detections of fluoride. Concentrations of fluoride are likely to be somewhat variable within the Long Island Creek Gneiss and wells screened in this formation may show different levels of fluoride in

groundwater. It is likely that GWC-32 is screened in a zone of slightly greater fluoride concentrations than the upgradient locations.

- B. On March 15 -16, 2018 ACC personnel sampled GWA-28, GWA-29, GWC-27, GWC-31, and GWC-32 for a suite of cations (calcium, magnesium, sodium, and potassium) and anions (carbonate, bicarbonate, sulfate, and chloride). The samples were collected using standard site sampling techniques and submitted to TAL-Pensacola for analysis. The analytical data are presented as Piper Plot and Stiff Diagrams. As shown in Figure 11, Piper Plot for Cell 3 Monitoring Wells and Figure 12, Stiff Diagrams for Cell 3 Monitoring Wells, there are no significant differences in the major ionic concentrations of the samples (i.e. all are low level and indicative of background conditions). This indicates that the chemical composition of groundwater between upgradient and downgradient locations are relatively similar in the vicinity of Cell 3. Therefore, all of these locations appear to represent background conditions as would be anticipated with a cell that has not received waste. The laboratory report and field purge logs are provided in Appendix A.

### 2.3.5 Summary and Recommendations

The CCR unit is not the source of the fluoride SSI. The apparent source is natural variability in groundwater. Testing of the rock unit present beneath a portion of Cell 3, the Long Island Creek Gniess confirm that fluoride concentrations in this unit are higher than at least two other rock units present in other areas of the site. A Piper Plot and Stiff Diagrams confirm that there are no significant differences in cation/anion ratios between any of the Cell 3 wells tested. Cell 3 has yet to receive waste, therefore the geochemical similarity between all locations is consistent with what would be anticipated. Groundwater monitoring location GWC-32 should remain in detection monitoring based on the identification of the alternate source.

---

---

## SECTION 3

### Conclusions and Recommendations

The *2017 Annual Groundwater Monitoring and Corrective Action Report* was prepared to satisfy the requirements of §257.90(e). In that report SSIs were identified for three groundwater monitoring locations: GWC-9 (boron), GWC-14 (boron and chloride) and GWC-32 (fluoride). This ASD has identified the following sources for each location with a SSI:

- GWC-9
  - A source other than the CCR unit caused the SSI (no waste placement near the well; operational issue)
  - Natural variation in groundwater quality (drought condition)
- GWC-14
  - A source other than the CCR unit caused the SSI (operational issue and repair)
- GWC-32
  - A source other than the CCR unit caused the SSI (no waste placement near the well)
  - Natural variation in groundwater quality (natural occurrence in rock formation)

All locations have met the requirements for a demonstration listed in §257.94(e)(2). Therefore, all locations should remain in detection monitoring at this time. Detection monitoring results should continue to be presented in the Annual Groundwater Monitoring and Corrective Action Reports, as well as state semi-annual groundwater monitoring reports.

## Qualifiers

### HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Login Sample Receipt Checklist

Client: Southern Company

Job Number: 400-150978-1

SDG Number: ASD

**Login Number: 150978**

**List Number: 1**

**Creator: Ott, Tina M**

**List Source: TestAmerica Pensacola**

Question	Answer	Comment
Radioactivity wasn't checked or is <math>\leq</math> background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	15.1°C IR7
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

## Narrative

### Job Narrative 400-150979-1

#### HPLC/IC

Method(s) 300.0: The method blank for analytical batch 391935 contained Sulfate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 300.0: The method blank for analytical batch 392174 contained Sulfate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

#### Metals

Method(s) 6020: The matrix spike (MS) recoveries for preparation batch 392217 and analytical batch 393106 were outside control limits. Insufficient spike in the matrix spike is suspected. The associated laboratory control sample (LCS) and post digestion spike (PDS) recoveries are within acceptance limits.

Method(s) 6020: The sample size used in the preparation of the matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 392217 and analytical batch 393106 was outside the 20% difference. As the relative percent difference (RPD) calculation is based upon the MS/MSD concentration as opposed to the MS/MSD percent recovery, elevated %RPD values were obtained.

#### General Chemistry

Method(s) SM 2320B: The sample duplicate precision for the following sample associated with analytical batch 391494 was outside control limits: (400-150979-A-2 DU). The associated Laboratory Control Sample(LCS) met acceptance criteria.

## Qualifiers

### HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

### General Chemistry

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

SDG Number: Gypsum Landfill Cells

**Login Number: 150979**

**List Number: 1**

**Creator: Ott, Tina M**

**List Source: TestAmerica Pensacola**

Question	Answer	Comment
Radioactivity wasn't checked or is <math>\leq</math> background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	4.4°C IR8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

## JOB DESCRIPTION

Plant Wansley Landfill

## JOB NUMBER

680-230703-1

# Eurofins Savannah

## Job Notes

The test results in this report meet NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted. Results pertain only to samples listed in this report. This report may not be reproduced, except in full, without the written approval of the laboratory. Questions should be directed to the person who signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

## Authorization

Authorized for release by  
David Fuller, Project Manager

# Definitions/Glossary

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 680-230703-1

## Qualifiers

### HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### General Chemistry

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Case Narrative

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 680-230703-1

---

**Job ID: 680-230703-1**

---

**Laboratory: Eurofins Savannah**

---

**Narrative**

**Job Narrative  
680-230703-1**

**Receipt**

The samples were received on 2/17/2023 7:47 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 0.3°C

**HPLC/IC**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**Metals**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**General Chemistry**

Method 2540C: A lesser volume of sample was used for the following samples due to the nature of the sample matrix resulting in elevated reporting limits: WAN-GWA-3, WAN-GWA-4 and WAN-GWC-12.

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-764123 was outside control limits: (680-230640-AD-1 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**Field Service / Mobile Lab**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

# Client Sample Results

Client: Southern Company

# Login Sample Receipt Checklist

Client: Southern Company

Job Number: 680-230703-1

**Login Number: 230703**

**List Source: Eurofins Savannah**

**List Number: 1**

**Creator: Harley, Tynisha**

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

# ANALYTICAL REPORT

## PREPARED FOR

Attn: Robert (Trey) Singleton  
Southern Company  
3535 Colonnade Parkway  
Bin S 530 EC  
Birmingham, Alabama 35243

Generated 3/2/2023 9:20:19 AM Revision 1

## JOB DESCRIPTION

Plant Wansley Landfill

## JOB NUMBER

680-230803-1

# Eurofins Savannah

## Job Notes

The test results in this report meet NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted. Results pertain only to samples listed in this report. This report may not be reproduced, except in full, without the written approval of the laboratory. Questions should be directed to the person who signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

## Authorization

Authorized for release by  
David Fuller, Project Manager  
[David.Fuller@et.eurofinsus.com](mailto:David.Fuller@et.eurofinsus.com)  
(770)344-8986

Revision 1

# Definitions/Glossary

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 680-230803-1

## Qualifiers

### HPLC/IC

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

## Narrative

### Job Narrative 680-230803-1

#### Revision 1

The report being provided is a revision of the original report sent on 2/28/2023. The report (revision 1) is being revised in order to correct the QC linking of the dilution analysis of the MS & MSD samples for Boron in Prep batch 764270.

#### Receipt

The samples were received on 2/18/2023 6:30 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.3°C

#### HPLC/IC

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

#### Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

#### General Chemistry

Method 2540C: A lesser volume of sample was used for the following sample due to the nature of the sample matrix resulting in elevated reporting limits: WAN-GWC-14.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

# Login Sample Receipt Checklist

Client: Southern Company

Job Number: 680-230803-1

**Login Number: 230803**

**List Source: Eurofins Savannah**

**List Number: 1**

**Creator: Johnson, Corey M**

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

# LOG OF TEST BORING

**BORING GWC-12**  
PAGE 1 OF 1

SOUTHERN COMPANY SERVICES, INC.  
EARTH SCIENCE AND ENVIRONMENTAL ENGINEERING

PROJECT Plant Wansley  
LOCATION Carrollton, Georgia

DATE STARTED 2/23/2011 COMPLETED 2/24/2011 SURF. ELEV. 721.02 COORDINATES: N - 1238738.52, E - 2028921.56

CONTRACTOR Boart Longyear EQUIPMENT \_\_\_\_\_ METHOD Rotasonic

DRILLED BY \_\_\_\_\_ LOGGED BY G. Dyer CHECKED BY \_\_\_\_\_ ANGLE \_\_\_\_\_ BEARING \_\_\_\_\_

BORING DEPTH 37.5 ft. GROUND WATER DEPTH: DURING 17 ft. COMP. \_\_\_\_\_ DELAYED \_\_\_\_\_

NOTES \_\_\_\_\_

GEOTECH ENGINEERING LOGS - ESEE DATABASE: BDT - 11/9/11 15:48 - T:\ESEE MAJOR PROJECTS\PROJECTS\WANSLEY\WANSLEY 2011\PLANT WANSLEY WELL LOGS.GPJ

DEPTH (ft)	GRAPHIC LOG	MATERIAL DESCRIPTION	SAMPLE TYPE NUMBER	SAMPLE DEPTH (ft.)	BLOW COUNTS (N VALUE)	RECOVERY % (RQD)	COMMENTS
0		<b>Poorly-graded Sand (SP)</b> - orange, damp, w/ trace organics					
5		<b>Poorly-graded Sand with Silt (SP-SM)</b> - mottled dark brown, tan, damp, w/ some medium sized gravels: sand = 70%, silt = 20%, and gravels = 10%. gravels are weathered gneiss, not very competent mod well sorted and poorly graded, potentially trace clays  - zonation of more tan sediment from 12' to 13'					7' - 8' more dry.
10							
15							
20		- red, wet, w/ few clays (approximately 5%)  - damp					
25		<b>Poorly-graded Sandy Gravel (SP)</b> - brown, red, slightly damp, w/ gravel  <b>Gneiss</b> - grey, white, slightly weathered gneiss weathering to silt, competent, some iron staining and pyrite staining w/ increasing depth - grey, white, moderate amounts of Fe oxide staining, heavy pyrite staining					
30							
35							
40		Bottom of borehole at 37.5 feet.					

**NOTE:**  
Elevation in feet North American Vertical Datum of 1988 (NAVD).  
Coordinates are in North American Datum of 1983 (NAD83) Georgia State Plane East Zone.  
Well resurveyed in December 2020.
